Society as a whole benefits from the implementation of carefully designed and sustainable programs for the management of mosquitoes and the diseases they transmit. The third edition of this successful publication has been comprehensively updated and expanded to provide the foundation of a more enlightened and informed approach to mosquito management. Public Health Significance of Urban Pests Xavier Bonnefoy, Helge Kampen, Kevin Sweeney, 2008. The second half of the 20th century and the beginning of the 21st century witnessed important changes in ecology, climate and human behaviour that favoured the development of urban pests. Most alarmingly, urban planners now face the dramatic expansion of urban sprawl in which city suburbs are growing into the natural habitats of ticks, rodents and other pests. Also, many city managers now erroneously assume that pest-borne diseases are relics of the past. All these changes make timely a new analysis of the direct and indirect effects of present-day urban pests on health. Such an analysis should lead to the development of strategies to manage them and reduce the risk of exposure. To this end, WHO invited international experts in various fields: pests, pest-related diseases and pest management to provide evidence on which to base policies. These experts identified the public health risk posed by various pests and appropriate measures to prevent and control them. This book presents their conclusions and formulates policy options for all levels of decision making to manage pests and pest-related diseases in the future. Pamphlets on Parasitology, 1895. **Integrated Pest Management** Dale G. Bottrell, Council on Environmental Quality (U.S.), 1979. Integrated pest management (IPM) is the selection, integration and implementation of pest control based on predicted economic, ecological and sociological consequences. IPM seeks maximum use of naturally occurring pest controls including weather, disease, agents, predators and parasites. In addition, IPM utilizes various biological, physical and chemical control and habitat modification techniques. Artificial controls are imposed only as required to keep a pest from surpassing intolerable

population levels predetermined from accurate assessments of the pest damage potential and the ecological sociological and economic costs of the control measures The presence of a pest species does not necessarily justify action for its control and in fact tolerable infestations may be desirable providing food for important beneficial insects for example Congressional Record United States.
