Gene Therapy for Cancer Kelly K. Hunt,Stephan A. Vorburger,Stephen G. Swisher,2007-10-26 The possibility of treating cancer a disease defined by genetic defects by introducing genes targeting these very alterations has led to an immense interest in gene therapy for cancer Although incremental successes have been realized enthusiasm for gene therapy has declined due to an increasing number of obstacles These obstacles include vector systems that do not reach systemic metastases therapeutic genes with redundant mechanisms allowing for cellular resistance and toxicities in clinical trials leading to premature closure of these studies

Different tactics to overcome or circumvent these obstacles have catalyzed the development of a wide range of gene therapy approaches. Thus far, almost two thirds of gene therapy trials have focused on cancer. This reflects the concept that gene therapy approaches for the treatment of cancer do not necessarily require long term expression of the gene as is necessary for the treatment of primary genetic defects like hemophilia or juvenile diabetes. Unlike the treatment of genetic defects where expression of the corrected gene needs to be strong, permanent and sometimes regulated, tactics to treat tumors can be based on temporary and locally limited effects. In addition, cancer cells have different properties than normal cells and this allows for targeting gene therapy to specific cells, a major advantage over current antitumor therapies which are also toxic to normal cells and tissues.

Challenges Associated with Identifying Preclinical Animal Models for the Development of Immune-based Therapies Rajan P. Adhikari, Rajat Varma, Silke Paust, An Coosemans, 2024-07-24

There hasn't been a better time to be a drug developer for immune based therapies than the past couple of decades. We have seen an explosion in immune based therapies for cancer, autoimmune and infectious diseases, metabolic diseases and diseases and disorders of the nervous system. The modalities of these immune based therapies span small molecules, biologics and gene and cell therapeutic approaches. Significant advances have been made in optimizing drug design for its specificity for the target, characterizing the mode of action in in vitro assays and ensuring safety and manufacturability. However, an area of challenge that remains is identifying animal models for evaluating efficacy and pharmacokinetics/pharmacodynamics relationship that are predictive of drug effects in humans. Discussion on this topic is warranted as examples of failures of translation from animal models to humans provide us an opportunity to learn more about human biology.
