Wireless Multi-hop Networks with Beamforming Antennas and Multi-user Detection Robert Vilzmann, 2009

Fundamentals of Differential Beamforming Jacob Benesty, Jingdong Chen, Chao Pan, 2016-04-27 This book provides a systematic study of the fundamental theory and methods of beamforming with differential microphone arrays DMAs or differential beamforming in short It begins with a brief overview of differential beamforming and some popularly used DMA beampatterns such as the dipole cardioid hypercardioid and supercardioid before providing essential background knowledge on orthogonal functions and orthogonal polynomials which form the basis of differential beamforming From a physical perspective a DMA of a given order is defined as an array that measures the differential acoustic pressure field of that order such an array has a beampattern in the form of a polynomial whose degree is equal to the DMA order Therefore the fundamental and core problem of differential beamforming boils down to the design of beampatterns with orthogonal polynomials But certain constraints also have to be considered so that the resulting beamformer does not seriously amplify the sensors self noise and the mismatches among sensors Accordingly the book subsequently revisits several performance criteria which can be used to evaluate the performance of the derived differential beamformers Next differential beamforming is placed in a framework of optimization and linear system solving and it is shown how different beampatterns can be designed with the help of this optimization framework The book then presents several approaches to the design of differential beamformers with the maximum DMA order with the control of the white noise gain and with the control of both the frequency invariance of the beampattern and the white noise gain Lastly it elucidates a joint optimization method that

can be used to derive differential beamformers that not only deliver nearly frequency invariant beam patterns but are also robust to sensors self noise

Time Multiplexed Beam-Forming with Space-Frequency

Transformation Wei Deng, Reza Mahmoudi, Arthur van Roermund, 2012-08-23 This book describes a unique approach to smart receiver system design. It starts with the analysis of a very basic single path receiver structure then using similar methods extends the analysis to a more complicated multi path receiver. Within the multi path structure two different types of phased array architectures are discussed: Analog beam forming and digital beam forming. The pros and cons are studied and the gaps are identified. Whereas previous books in this area focus mainly on phased array circuit implementations, this book fills a gap by providing a system level approach and introduces new methods for developing smart systems.

Statistical Robust Beamforming for Broadcast Channels and Applications in Satellite Communication Andreas Gründinger, 2019-11-27 This book investigates adaptive physical layer beamforming and resource allocation that ensure reliable data transmission in the multi antenna broadcast channel. The book provides an overview of robust optimization techniques and modelling approximations to deal with stochastic performance metrics. One key contribution of the book is a closed form description of the achievable rates with unlimited transmit power for a rank one channel error model. Additionally, the book provides a concise duality framework to transform mean square error (MSE) based beamformer designs (e.g. quality of service and balancing optimizations) into equivalent uplink filter designs. For the algorithmic solution, the book analyses the following paradigm: transmission to receivers with large MSE targets (low demands) is switched off if the transmit power is low. The book also studies chance constrained optimizations for limiting the outage probability. In this context, the book provides two novel conservative outage probability approximations that result in convex beamformer optimizations. To compensate for the remaining inaccuracy, the book introduces a post processing power allocation. Finally, the book applies the introduced beamformer designs for SatCom where interference from neighboring spotbeams and channel fading are the main limitations.

Development of Novel Backscatter Communication Systems Using a Multi-hop Framework and Distributed Beamforming Vikram Reddy Surendra, 2010 The goal of this thesis is to develop a wireless networking framework for battery free devices based on passive backscatter communication In contrast to traditional active communication systems where the radio signal has to be generated using large amount of energy from batteries the passive systems reflect the RF signal The information is encoded by modulating the reflected signal which consumes significantly less energy than active transmission The existing passive backscatter systems have limited communication capabilities For example the Radio Frequency Identification RFID systems support short distance direct communication between active reader and passive tags The communication range is limited due to power and sensitivity limitations of transmitters and receivers respectively Moreover in contrast to a multi hop ad hoc and sensor networks the traditional backscatter systems limit themselves to a single hop topology due to limited capabilities of passive tags and different challenges in passive communication Existing literature lacks of understanding how such multi hop passive and asymmetric networks can be realized and what are their theoretical limits This thesis aims at understanding the communication and coverage challenge in backscatter systems and addressing them through a distributed beamforming that increases the transmission range to a specific tag location PAPER I and b a multi hop framework for the backscatter communication that increases effective communication range PAPER II The proposed beamforming methodology employs spatially distributed passive scattering devices located between transmitter and receiver to increase the RF signal strength The theoretical limits of such scheme are analyzed mathematically and in simulations with two beamforming approaches being proposed Furthermore a novel architecture is proposed for multi hop backscatter based networking for a passive RF

communication that is not currently present The paper presents the generic analysis of the system capabilities and demonstrates the feasibility of such multi hop network Furthermore the connectivity models are studied in terms of k connectivity of such a network of tags Abstract leaf iv

Array Processing Jacob Benesty, Israel Cohen (Professor of electrical engineering), Jingdong Chen, 2019-06-04 The focus of this book is on array processing and beamforming with Kronecker products It considers a large family of sensor arrays that allow the steering vector to be decomposed as a Kronecker product of two steering vectors of smaller virtual arrays Instead of directly designing a global beamformer for the original array once the steering vector has been decomposed smaller virtual beamformers are designed and separately optimized for each virtual array This means the matrices that need to be inverted are smaller which increases the robustness of the beamformers and reduces the size of the observations The book explains how to perform beamforming with Kronecker product filters using an unconventional approach It shows how the Kronecker product formulation can be used to derive fixed adaptive and differential beamformers with remarkable flexibility Furthermore it demonstrates how fixed and adaptive beamformers can be intelligently combined optimally exploiting the advantages of both The problem of spatiotemporal signal enhancement is also addressed and readers will learn how to perform Kronecker product filtering in this context
