the missing link in the domain of functional genomics viz genomic architecture It begins with a deconstruction of the Darwinian paradigm using the proposed model of modified involuted manifolds It recasts the process of natural selection as a process of information transfer Using a topological model this book outlines a new genomic architecture The key argument for this proposed model is that such structuralism has always been implicit in genomics The proposed model fits very well with the known genomic characteristics and allows to separate the regulatory genome from the transcriptive genomes The model is capable of discerning modular architecture of genomes with different genomic functionalities existing in hierarchical relationships and demonstrates that genomes act as units of selection and as the environment for the individual genes which act as competing species Towards the end the book also examines the role of genomic evolution in cancer and the principles of natural selection and evolution of the genotype The regulatory genome is also discussed with an emphasis on its evolution and natural selection It is a valuable source for researchers working in functional genomics mathematical modeling in biology and evolutionary genomics **Mimicking the Extracellular Matrix** Gregory A Hudalla, William L

Murphy,2019-03-15 The extracellular matrix ECM is the focus of much interest in biology and bioengineering Increasing understanding of the influence of the ECM on cell behaviour has led to the exciting possibilities of tissue engineering Aside from new therapeutic tools understanding the ECM is of course fundamental to basic cell biology research Mimicking the Extracellular Matrix approaches this topic from both basic science and practical engineering perspectives Seven topics are approached each in a pair of chapters one with a biological approach and its partner with a bioengineering approach Topics include the mechanical properties of the ECM which outlines current knowledge of the ECM physical structure and reviewing state of the art strategies to mimic its native microenvironments The organisational characteristics of the ECM form the focus of another pair of chapters where the collagen triple helix is discussed followed by a review of advances in artificial reproduction of well ordered systems using self assembling peptides or peptide amphiphiles The balanced approach of this text gives it a broad appeal to those interested in the ECM from a range of backgrounds and disciplines Suitable for undergraduates postgraduates and academics this text aims to unify the current knowledge of ECM biology and matrix mimicking biomaterials
