

Chapitre II :

Cycles de développement et cycles chromosomiques.

Introduction :

Les cycles de développement des êtres vivants diploïdes se caractérisent par l'alternance de deux phénomènes fondamentaux (**Doc-1**) : **La fécondation** qui aboutit à la formation d'un œuf (zygote) diploïde ($2n$), et la **méiose** qui produit des cellules haploïdes (n) qui se différencient ensuite en gamètes haploïdes, ou tout simplement en spores haploïdes capables de germer et donner des individus haploïdes.

L'alternance de ces deux phénomènes biologiques maintient le nombre des chromosomes constant au fil des générations d'une espèce biologique, et on distingue dans le cycle de développement de toute espèce biologique la succession de deux phases (une diploïde et une autre haploïde), dont les durées respectives sont déterminées par l'emplacement de la fécondation par rapport à la méiose dans le cycle de développement.

Doc-1 : Rôle de la fécondation (a) et la méiose (b) dans l'alternance des phases haploïde et diploïde dans le cycle de développement des espèces diploïdes (c).

Problématique:

- + Quels sont les différents types cycles de développement ? et comment peut-on les distinguer ?
- + Comment la fécondation et la méiose assurent-elles la continuité des espèces et le maintien du nombre de leurs chromosomes constant d'une génération à l'autre ?
- + Comment on représente les cycles de développement par des cycles chromosomiques correspondants ?
