

## Oxidative Phosphorylation

How does the membrane potential ( $\Delta\psi$ ) and the  $\text{H}^+$  gradient make ATP during cellular respiration?

### What?

The synthesis of cellular respiration is oxidative phosphorylation. Both the electron transport chain and chemiosmosis make up oxidative phosphorylation. During this phase of cellular respiration, about 34  $\text{NADH}$  and 14  $\text{FADH}_2$  are sent produced to three phases of cellular respiration: glycolysis, the Krebs cycle, and chemiosmosis are used to make ATP. The proton motive force provides energy embedded in the oxygen membrane potential.

### Model 1 – Electron Transport Chain

1. Consider the chemiosmosis diagramming model. Clearly illustrate of the chemiosmosis before when this might be found.
