Waking the Power Within Thermodynamics and the Human Battery Professor ibrahim elnoshokaty , The sci fi film The Matrix introduces a fascinating premise where humans function as energy sources for an advanced machine society In this fictional world human bodies are maintained in a state of suspended animation while their minds exist in a virtual reality allowing machines to extract their bioelectric thermal and kinetic energy This article investigates the scientific feasibility of utilizing humans as a power source by applying thermodynamic principles According to the first law of thermodynamics the energy required to sustain human life would result in a net energy loss for the machines The second law indicates that the system s entropy would rise rendering it an inefficient energy strategy Furthermore the energy output of a human body even if fully utilized would be inadequate to meet the machines energy demands More efficient alternatives for the machines would include other biological power sources and energy harvesting techniques such as solar or nuclear power The article concludes that while the concept of human batteries serves as an engaging storytelling element it is not a scientifically viable solution for the machines energy requirements The machines choice to preserve human life may be motivated by other factors such as leveraging their collective cognitive abilities for computational purposes or adhering to an ethical code that prohibits the complete annihilation of humanity This investigation aims to fill the gap by providing a detailed thermodynamic analysis of the energy expenditure required to sustain human life in a suspended animation state and the inefficiency of this system as an energy source for machines a facet previously unexplored By elucidating the thermodynamic constraints of human based energy sources this study not only challenges a popular sci fi narrative but also enriches our understanding of bioenergetic processes and their implications for future energy harvesting technologies

Globalizing the Soybean Ines Prodöhl, 2023-03-09 Globalizing the Soybean asks how the soybean conquered the West and analyzes why and how the crop gained entry into agriculture and industry in regions beyond Asia in the first half of the twentieth century Historian Ines Prodöhl describes the soybean's journey centered on three hubs Northeast China as the crop's main growing area up to the Second World War Germany to where most of the beans in the interwar period were shipped and the United States which became the leading cultivator of soy worldwide during the 1940s This book explores the German and U.S. adoption of the soybean being closely tied to global economic and political changes such as the two world wars and the Great Depression The attraction of the soybean to stakeholders on both sides of the Atlantic was linked to a need for cheap alternatives to butter and lard and a desire for greater quantities of meat which led to the soybean becoming a cheap resource for fat and fodder Only occasionally was it also used as food This volume is useful for anyone who is studying or interested in economic history and commodity trading in the twentieth century It is also connected to the histories of capitalism globalization imperialism and materiality
