Parallax Alan W. Hirshfeld, 2002-05-01 In the dramatic tradition of the best selling *Longitude* *Parallax* charts the historical path of observational astronomy's most daunting challenge measuring the distance to a star The greatest scientific minds applied themselves in vain to the problem across the millennia beginning with the ancient Greeks Not until the nineteenth century would three astronomers armed with the best telescopes of the age race to conquer this astronomical Everest their contest ending in a virtual dead heat Against a sweeping backdrop filled with kidnappings dramatic rescue swordplay madness and bitter rivalry Alan Hirshfeld brings to life the heroes of this remarkable story Meet the destitute boy plucked from a collapsed building who becomes the greatest telescope maker the world has ever seen the hot tempered Dane whose nose is lopped off in a duel over mathematics the merchant's apprentice forced to choose between the lure of money and his passion for astronomy and the musician who astounds the world by discovering a new planet from his own backyard Generously illustrated with diagrams period engravings and paintings *Parallax* is an unforgettable tale that illuminates the distinctly human side of science

Experiments for Future Astronomers Robert Gardner, Joshua Conklin, 2016-12-15 What do physics math space and the night sky have in common They are all topics that interest astronomers This title will introduce budding scientists to hands on experiments that may spark their interest in a career in astronomy All books contain descriptions of the scientific method lab safety guidelines and career information Color drawings illustrate experimental setups and scientific ideas Great ideas for science fair projects that incorporate math and science are included throughout the book

Fundamentals of Astronomy Cesare Barbieri, Ivano Bertini, 2020-11-24 Providing a broad overview of foundational concepts this second edition of *Fundamentals of Astronomy* covers topics ranging from spherical astronomy to reference systems and celestial mechanics to astronomical photometry and spectroscopy It expounds arguments of classical astronomy that provided the foundation for modern astrometry whilst presenting the latest results of the very long baseline interferometry VLBI radio technique optical interferometers and satellites such as Hipparcos and GAIA and recent resolutions of the IAU and IERS regarding precession forced and free nutation and Earth figure and rotation Concepts of general relativity are explored such as the advance of Mercury's perihelion light deflection and black holes in addition to the physical properties orbits and ephemerides of planets comets and asteroids with an extension to visual binary stars orbital reconstruction Extrasolar planets are also discussed with reference to radial velocity and transits measurements by ground and space telescopes Basic concepts of astronomical photometry spectroscopy and polarimetry are given including the influence of the terrestrial atmosphere Classical works such as Hipparchus are mentioned in order to provide a flavor of the historical development of the field It is an ideal textbook for undergraduate and graduate students

system and into his subjects private lives William developed bizarre theories about inhabitants of the sun he procured an unheard of salary for Caroline from King George III even as he hassled over the funding for an enormous forty foot telescope and the siblings feuded over William s marriage but eventually reconciled *Nicolaus Copernicus* Owen Gingerich,James MacLachlan,2005-06-16 Born in Poland in 1473 Nicolaus Copernicus launched a quiet revolution No scientist so radically transformed our understanding of our place in the universe as this curious bishop s doctor and church official In his quest to discover a beautiful and coherent system to describe the motions of the planets Copernicus placed the sun in the center of the system and made the earth a planet traveling around the sun Today it is hard to imagine our solar system any other way but for his time Copernicus s idea was earthshaking In 1616 the church banned his book *Revolutions* because it contradicted the accepted notion that God placed Earth in the center of the universe Even though those who knew of his work considered his idea dangerous *Revolutions* remained of interest only to other scientists for many years It took almost two hundred years for his concept of a sun centered system to reach the general public None the less what Copernicus set out in his remarkable text truly revolutionized science For this Copernicus a quiet doctor who made a tremendous leap of imagination is considered the father of the Scientific Revolution Oxford Portraits in Science is an on going series of scientific biographies for young adults Written by top scholars and writers each biography examines the personality of its subject as well as the thought process leading to his or her discoveries These illustrated biographies combine accessible technical information with compelling personal stories to portray the scientists whose work has shaped our understanding of the natural world The Georgian Star Michael D. Lemonick,2009 In 1781 William Herschel won international fame for discovering Uranus the seventh planet from the sun In documenting a new planet something no one had done since the dawn of civilization he expanded our perception that we are part of something much greater than the immediately visible solar system Herschel remains most famous for this discovery but as *The Georgian Star* makes vividly clear he accomplished much more After a successful career as a professional musician he turned his attention to astronomy in his mid thirties With his sister Caroline as a partner he pioneered techniques that are still used by astronomers today The Herschels were the first to map the night sky listing and categorizing every object they could see To do so they built a massive forty foot tall telescope under the patronage of King George III They were also the first to propose that the visible stars surrounding our little planet are only a fraction of those that make up a continually evolving universe William s restless intelligence led further still to the discovery of infrared radiation invisible radiation that has a wavelength longer than microwaves but shorter than that of visible light Caroline assembled an exhaustive catalog of nebulae the beautiful cloudy assemblages of dust and stellar light Erudite and accessible *The Georgian Star* is a lively portrait of the pair who invented modern astronomy BOOK JACKET *The Haunted Observatory* Richard Baum,2007-06-05 For many centuries observers of the night sky interpreted the moving planets and the surrounding starry realms in terms of concentric crystalline spheres in the center of which hung the Earth the hub of

creation But with the discoveries of Galileo Copernicus Kepler and Newton astronomers were suddenly struck by a momentous truth the solar system was neither small nor intimate but extended an unfathomable distance toward countless even more distant stars The endless possibilities of these astounding developments fired scientists imaginations leading both to further discoveries and to flights of fancy While newly discovered facts are important and interesting the quaint curiosities and spectral ghosts that led scientists astray have a fascination of their own This is the subject of astronomer Richard Baum in this elegant narrative about the mysteries and wonders of celestial exploration The fabled mountains of Venus a city in the moon ghostly rings around Uranus and Neptune bright inexplicable objects seen near the sun and the truth behind Coleridge s Star dogged Moon in his famous poem about the Ancient Mariner these are just some of the intriguing twists and turns that astronomers took while investigating our starry neighbors Baum vividly conveys the romance of astronomy at a time when the vistas of outer space were a new frontier and astronomers guided only by imagination and analogy set forth on uncharted seas and were haunted for a lifetime by marvels both seen and imagined *Finding our Place in the Solar System* Todd Timberlake,Paul Wallace,2019-03-28 Finding our Place in the Solar System gives a detailed account of how the Earth was displaced from its traditional position at the center of the universe to be recognized as one of several planets orbiting the Sun under the influence of a universal gravitational force The transition from the ancient geocentric worldview to a modern understanding of planetary motion often called the Copernican Revolution is one of the great intellectual achievements of humankind This book provides a deep yet accessible explanation of the scientific disputes over our place in the solar system and the work of the great scientists who helped settle them Readers will come away knowing not just that the Earth orbits the Sun but why we believe that it does so The Copernican Revolution also provides an excellent case study of what science is and how it works **Victorian Glassworlds** Isobel Armstrong,2008-04-24 Isobel Armstrong s startlingly original and beautifully illustrated book tells the stories that spring from the mass production of glass in nineteenth century England Moving across technology industry local history architecture literature print culture the visual arts optics and philosophy it will transform our understanding of the Victorian period The mass production of glass in the nineteenth century transformed an ancient material into a modern one at the same time transforming the environment and the nineteenth century imagination It created a new glass culture hitherto inconceivable Glass culture constituted Victorian modernity It was made from infinite variations of the prefabricated glass panel and the lens The mirror and the window became its formative elements both the texts and constituents of glass culture The glassworlds of the century are heterogeneous They manifest themselves in the technologies of the factory furnace in the myths of Cinderella and her glass slipper circulated in print media in the ideologies of the conservatory as building type in the fantasia of the shopfront in the production of chandeliers in the Crystal Palace and the lens made images of the magic lantern and microscope But they were nevertheless governed by two inescapable conditions First to look through glass was to look through the residues of the breath of an unknown artisan

because glass was mass produced by incorporating glassblowing into the division of labour Second literally a new medium glass brought the ambiguity of transparency and the problems of mediation into the everyday It intervened between seer and seen incorporating a modern philosophical problem into bodily experience Thus for poets and novelists glass took on material and ontological political and aesthetic meanings Reading glass forwards into Bauhaus modernism Walter Benjamin overlooked an early phase of glass culture where the languages of glass are different The book charts this phase in three parts Factory archives trade union records and periodicals document the individual manufacturers and artisans who founded glass culture the industrial tourists who described it and the systematic politics of window breaking Part Two culminating in glass under glass at the Crystal Palace reads the glassing of the environment including the mirror the window and controversy round the conservatory and their inscription in poems and novels Part Three explores the lens from optical toys to philosophical instruments as the telescope and microscope were known A meditation on its history and phenomenology Victorian Glassworlds is a poetics of glass for nineteenth century modernity

The Life and Work of James Bradley John Fisher, 2024-03-08 James Bradley once the most celebrated astronomer in Europe is now an obscure figure surprising given that he was the first to establish empirically that the Earth was a planet in motion around the Sun Introduced to the science of positional astronomy by his uncle James Pound he excelled in his abilities to make precise observations Mentored by Edmond Halley he observed Jupiter and its satellites identifying the gravitational resonances of the three innermost Galilean satellites before being proposed to the fellowship of the Royal Society by Halley with the approval of Newton Elected to the Savilian Chair in Astronomy at Oxford he joined Samuel Molyneux and George Graham in the attempt to observe annual parallax at Kew based on the attempt of Robert Hooke This experiment revealed a counter intuitive motion of the object star that defied all attempts at the resolution of the problem He designed a research programme at Wanstead when he studied the motions of 70 stars identifying a new discovered motion later called the aberration of light Recognising another motion within the residuals of his observations he identified it as a nutation of the Earth's axis He taught experimental philosophy at Oxford for 31 years His final work as Astronomer Royal was a stellar survey of unprecedented dependability taking note of every possible cause of error later reduced by Friedrich Wilhelm Bessel in his *Fundamenta Astronomi* producing a stellar catalogue of 3 222 stars
