Mechanics In The Earth And Environmental Sciences:

Mechanics in the Earth and Environmental Sciences Gerard V. Middleton, Peter R. Wilcock, 1994-08-26 The study of the Earth and the environment requires an understanding of the physical processes within and at the surface of the Earth This book will allow the student to develop a broad working knowledge of mechanics and its application to the earth and environmental sciences The mathematics are introduced at a level that assumes only an understanding of first year calculus The concepts are then developed to allow an understanding of the basic physics for a wide range of natural processes These are illustrated by examples from many real situations such as the application of the theory of flow through porous media to the study of groundwater the viscosity of fluids to the flow of lava and the theory of stress to the study of faults The breadth of topics will allow students and professionals to gain an insight into the workings of many aspects of the Earth's systems

Earth Surface Processes Philip A. Allen, 2009-05-27 Earth Surface Processes is an introductory text for those studying the dynamics of fluid and sediment transport in the environments in the context of both present day patterns as well as the environmental changes decipherable in the geological record The book is divided into two parts The first deals with the global scale aspects of the earth's surface system The second part focuses on the physical underpinnings for fluid and sediment transport in a number of settings found at the earth's surface and in its oceans Earth Surface Processes fits into the literature of the broad holistic discipline of Earth System Science The author illustrates the physical principles of earth's surface processes and explains the relevant theories by quantitative practical exercises The pioneering textbook on the new sedimentology One of the first textbooks to adopt the Earth Systems approach to geology developed at Penn State and Stanford Should reinvigorate more traditional courses in physical sedimentology and dynamical sedimentology Successfully marries the innovative holistic approach to Earth Systems with the traditional reductionist approach to sedimentary processes Explains both the global scale Earth Surface System and the fluid dynamics and sedimentary transport processes that underlie this Quantitative approach is reinforced with worked examples and solutions Richly illustrated with original diagrams and a colour plate section

Stress Field Control of Eruption Dynamics Roberto Sulpizio, Antonio Costa, Geoffrey Wadge, 2017-10-10 Increasing evidence supports the claim that stress changes play a fundamental role in triggering volcanic eruptions Stress changes may vary in origin to include earthquakes erosion and landslide processes deglaciation or tidal effects The local stress can also change as response of magma influx from deeper reservoirs and an increase of the magma gas pressure The stress transfer may be of great importance in reawakening a dormant system As an example significant statistical correlation of large earthquakes and eruptions in time and space was suggested in many works The interaction may be two fold where magma intrusions may change the stress at active faults and trigger earthquakes while tectonic earthquakes may affect the magmatic system and change the eruption activity The change in local tectonic stress has been claimed as trigger of large ignimbrite eruptions or for controlling the eruptive style of explosive eruptions Sometimes volcano systems that are nested or closely located may become active in chorus neighbouring volcanoes may interact in the sense that one volcano triggers its neighbouring volcano However although there is ample evidence of concurrence the processes of interacting volcanoes and near to far field tectonic stress are not well understood Some studies suggest that volcanic eruptions are triggered if compressive stress acts at the magma system and squeezes out magma Other studies suggest that extensional stress fields facilitate magma rise and thus encourage eruptions or that fluctuating compression and extension during the passing of seismic waves trigger eruptions This research topic tries to address some of the important open questions in interaction between stress field and volcanic eruption though both review papers and new contributions

Physical and Mathematical Modeling of Earth and Environment Processes (2018)

V. I. Karev, Dmitry Klimov, Konstantin Pokazeev, 2019-03-24 This book entitled Physical and Mathematical Modeling of Earth and Environment Processes is the result of a collaborative work after the 4th international scientific youth forum held at the IPMech RAS on November 1 3 2018 The book includes theoretical and experimental studies of processes in the atmosphere oceans the lithosphere and their interaction environmental issues problems of human impact on the environment methods of geophysical research A special focus is given to the extraction of hydrocarbon resources including unconventional sources This book also focuses on new approaches to the development of hydrocarbon fields very important in today's geopolitical conditions The book presents new results of the experimental and theoretical modeling of deformation fracture and filtration processes in the rocks in connection with issues of creating scientific fundamentals for new hydrocarbon production technologies
