*Rock Mass Stability Around Underground Excavations in a Mine* Yan Xing, Pinnaduwa Kulatilake, Louis Sandbak, 2019-11-20 Stability of underground excavations is of great importance to an operating mine because it ensures the

safety of the working people and operating equipment and successful ore production Due to the complex geological conditions and mine constructions and variability and uncertainty in estimating rock mass mechanical properties the assessment of rock mass stability for an underground mine is extremely challenging and difficult Tackling of this difficult problem is not covered in detail in any of the textbooks currently available in the rock mechanics literature This monograph aims to cover this gap in the rock mechanics and rock engineering field This monograph provides detailed procedures for the stability assessment and support design for an underground mine case study It covers the background of the mine site including the monitored deformation data the state of art methodologies for the stability analysis of rock masses around underground excavations performed laboratory tests estimation of the rock mass properties a brief theory and background of the 3 D Distinct Element Code 3DEC and numerical modeling of underground rock mass stability including investigation of the effectiveness of rock supports The monograph is an excellent reference for the senior undergraduates graduate students researchers and practitioners who work in the Underground Rock Mechanics and Rock Engineering area in the Mining Engineering Civil Geotechnical Engineering and DEM Distinct Element Method Numerical modeling

**Engineering Rock Mass Classification** R K Goel, Bhawani Singh, 2011-08-09 Rock mass classification methods are commonly used at the preliminary design stages of a construction project when there is very little information It forms the bases for design and estimation of the required amount and type of rock support and groundwater control measures Encompassing nearly all aspects of rock mass classifications in detail Civil Engineering Rock Mass Classification Tunnelling Foundations and Landsides provides construction engineers and managers with extensive practical knowledge which is time tested in the projects in Himalaya and other parts of the world in complex geological conditions Rock mass classification is an essential element of feasibility studies for any near surface construction project prior to any excavation or disturbances made to earth Written by an author team with over 50 years of experience in some of the most difficult mining regions of the world Civil Engineering Rock Mass Classification Tunnelling Foundations and Landsides provides construction engineers construction managers and mining engineers with the tools and methods to gather geotechnical data either from rock cuts drifts or core and process the information for subsequent analysis The goal is to use effective mapping techniques to obtain data can be used as input for any of the established rock classification systems The book covers all of the commonly used classification methods including Barton s Q and Q systems Bieniawski s RMR Laubscher s MRMR and Hoek s and GSI systems With this book in hand engineers will be able to gather geotechnical data either from rock cuts drifts or core and process the information for subsequent analysis Rich with international case studies and worked out equations the focus of the book is on the practical gathering information for purposes of analysis and design Identify the most significant parameters influencing the behaviour of a rock mass Divide a particular rock mass formulation into groups of similar behaviour rock mass classes of varying quality Provide a basis of understanding the characteristics of each rock mass class Relate the experience of rock

conditions at one site to the conditions and experience encountered at others Derive quantitative data and guidelines for engineering design Provide common basis for communication between engineers and geologists      *Crustal Permeability* Tom Gleeson, Steve Ingebritsen, 2016-11-30 Permeability is the primary control on fluid flow in the Earth's crust and is key to a surprisingly wide range of geological processes because it controls the advection of heat and solutes and the generation of anomalous pore pressures The practical importance of permeability and the potential for large dynamic changes in permeability is highlighted by ongoing issues associated with hydraulic fracturing for hydrocarbon production fracking enhanced geothermal systems and geologic carbon sequestration Although there are thousands of research papers on crustal permeability this is the first book length treatment This book bridges the historical dichotomy between the hydrogeologic perspective of permeability as a static material property and the perspective of other Earth scientists who have long recognized permeability as a dynamic parameter that changes in response to tectonism fluid production and geochemical reactions      *Landslides from Massive Rock Slope Failure* Stephen G. Evans, Gabriele Scarascia Mugnozza, Alexander Strom, Reginald L. Hermanns, 2007-05-17 Amongst the thematic topics discussed are global frequency impacts on society analysis of initial rock slope failure monitoring of rock slope movement analysis and modeling of post failure behaviour volcanic landslides and influences of massive rock slope failure on the geomorphological evolution of mountain regions Regional contributions include reports on rockslides and rock avalanches in Norway western Canada the Andes of Argentina the Karakoram Himalaya the European Alps the Appennines and the mountains of Central Asia Rockslides and rock avalanches in the Central Asian republics of the former Soviet Union are discussed in detail for the first time in an English language book These landslides include the 1911 Usoi rockslide that dammed 75 km long Lake Sarez and the 1949 Khait rock avalanche that may have killed up to 28 000 people Both landslides were earthquake triggered and both are located in Tajikistan An additional highlight is a detailed description and analysis of large scale artificial rock avalanches triggered by underground nuclear explosions during the testing programme of the former Soviet Union
