**Exploring Biology in the Laboratory: Core Concepts** Murray P. Pendarvis, John L. Crawley, 2019-02-01 Exploring Biology in the Laboratory Core Concepts is a comprehensive manual appropriate for introductory biology lab courses This edition is designed for courses populated by nonmajors or for majors courses where abbreviated coverage is desired Based on the two semester version of Exploring Biology in the Laboratory 3e this Core Concepts edition features a streamlined set of clearly written activities with abbreviated coverage of the biodiversity of life These exercises emphasize the unity of all living things and the evolutionary forces that have resulted in and continue to act on the diversity that we see around us today

**Sizing up Consciousness** Marcello Massimini, Giulio Tononi, 2018-05-31 Everyone knows what consciousness is it is what vanishes when we fall into dreamless sleep and reappears when we wake up or when we dream However we become less and less confident when we are called to answer fundamental questions about the relationships between consciousness and the physical world Why is the cerebral cortex associated with consciousness but not the liver the heart the cerebellum or other neural structures Why does consciousness fade during deep sleep while cortical neurons remain active Can unresponsive patients with an island of active cortex surrounded by widespread damage be conscious Is an artificial system that outperforms people at driving recognizing faces and objects and answering difficult questions conscious Using the Integrated Information Theory IIT as a guiding principle Sizing up Consciousness explores these questions taking the reader along a fascinating journey from the cerebral cortex to the cerebellum from wakefulness to sleep anesthesia and coma supercomputers octopuses dolphins and much more besides By translating theoretical principles into practical measurements the book outlines a preliminary attempt to identify a general rule to size up the capacity for consciousness within the human skull and beyond Sizing up Consciousness is a short accessible book spanning neuronal activity to existential considerations and is essential reading for anyone interested in awareness and cognition

**The Biology of Death** André Klarsfeld,Frédéric Revah,2004 Why do we die Do all living creatures share this fate Is the body's slow degradation with the passage of time unavoidable or can the secrets of longevity be unlocked Over the past two decades scientists studying the workings of genes and cells have uncovered some of the clues necessary to solve these mysteries In this fascinating and accessible book two neurobiologists share the often surprising findings from that research including the possibility that aging and natural death may not be forever a certainty for most living beings Andr Klarsfeld and Fr d ric Revah discuss in detail the latest scientific findings and views on death and longevity They challenge many popular assumptions such as the idea that the death of individual organisms serves to rejuvenate species or that death and sexual reproduction are necessarily linked Finally they describe current experimental approaches to postpone natural death in lower organisms as well as in mammals Are all organisms that survive until late in life condemned to a natural death as a consequence of aging even if they live in a well protected supportive environment The variability of the adult life span from a few hours for some insects to more than a millennium for the sequoia and thirteen times that for certain wild berry bushes challenges the notion that death is unavoidable Evolutionary theory helps explain why and how some species have achieved biological mechanisms that seemingly allow them to resist time Death cannot be understood without looking into cells the essential building blocks of life Intriguingly at the level of cells death is not always an accident it is often programmed as an indispensable aspect of life which benefits the organism as a whole

*Molecular Tinkering* Ben Martynoga,2018-09-11 Reveals some of the thrilling developments that have transformed biology since the 1960s Highlights the challenges ahead for biologists but suggests what they can learn from the past Energetic jargon free writing that will appeal to a broad audience During the 1960s Edinburgh became a hotbed for a forward thinking group of biologists This is the story of these innovators who saw that life's big mysteries were best tackled by studying its molecular foundations It introduces the eccentric thinkers ingenious tinkerers and tenacious experimenters who broke down the cultural barriers between traditional scientific disciplines They produced a series of transformative ideas and tools that

wholly reoriented biology Edinburgh scientists invented genetic engineering They laid the foundations for DNA fingerprinting and the human genome project They also cloned Dolly the sheep purified the first gene and kick started the now influential fields of epigenetics and systems biology Yet Edinburgh s leading role in most of these world changing stories have not been told before Ben Martynoga intertwines science biography and anecdote to describe the roots and lasting significance of key biological concepts He describes the crucial micro details the blind alleys botched experiments and chance encounters to give a rare insight into the way science really progresses Now in the 21st century biology is increasingly a big science endeavour A deeper understanding of biology could deliver not only new drugs and diagnostics but also improved ways to feed clothe and fuel us But the world still awaits the long promised fruits of biology s molecular revolution The successes of Edinburgh s unsung molecular pioneers remind us why it is crucial to carve out space for small scale curiosity led research
