Advances in the Ecology of Stream-Dwelling Salmonids Javier Lobon-Cervia, Phaedra Budy, Robert Gresswell, 2024-02-29 Many salmonids inhabit streams during the whole or a substantial part of their lifetime Streams as networks of cold waters running over riffles pools and tables of gravel pebble and stony substratum are fed by rainfall and snowmelt and may be subject to spates and droughts Hence these lotic systems are heterogeneous by nature and vary substantially in temperature and discharge along their environmental gradients In these habitats salmonids encounter suitable reproductive and feeding habitats where they exhibit a dizzying array of life history traits and an overwhelming variability in size growth and density Essentially predators upon organisms drifting across the water column they become apex piscivores at large sizes They may also serve as prey for aquatic macroinvertebrates at the youngest stages and as they grow they may become prey for birds and mammals In addition many populations play a major role in the recycling of biogeochemical elements critical for the trophic dynamics of their home streams Empirical assessment of the ecological functioning of stream salmonids has been a tireless endeavor since the pioneer studies by Allen 1951 Chapman 1966 McFadden 1964 and Northcote 1966 further enhanced by the IBP 1964 1974 Gerking 1967 and extended to experimental approaches during the last decades Northcote Lobon Cervia 2010 Lobon Cervia Sanz 2017 Kershner et al 2019 It has become increasingly apparent that streams are severely threatened by

human abuse and misuse including over extraction diversion damming and pollution in addition to the more recent threat of global warming Furthermore salmonids themselves are threatened by genetic introgressions diseases and parasites related to uncontrolled introductions of individuals from aquaculture and over exploitation by angling These threats have triggered important social and political concerns to the extent of becoming research priorities for major agencies and institutions In this context we attempt to add an overview to this endeavor by updating and summarizing the documented ecology of stream living salmonids with reference to the factors and mechanisms underlying the growth density and life history that interact to determine the size number and distribution of individuals encountered in any wild population
