**Micropropagation of Woody Plants** M.R. Ahuja, 2013-06-29 This volume covers recent advances in the vegetative propagation of woody plants by tissue culture. A wide range of topics relevant to micropropagation of woody plants are discussed by renowned international scientists. These include cellular control of morphogenesis, light regimes in tissue culture, maturation and rejuvenation, synthetic seed, genetics of micropropagated plants, haploid embryogenesis, protoplast culture, and acclimatization of ex vitro woody plants. In addition to micropropagation of selected woody plants, both gymnosperms and angiosperms, this volume also includes in vitro genetic selection, strategic planning for application of biotechnology for genetics and breeding, and clonal options for woody plant improvement. A balanced view of both perspectives and limitations of woody plant micropropagation is presented.

**Cryopreservation of Plant Germplasm II** L.E. Towill, Y.P.S. Bajaj, 2002-04-11 This volume highlights achievements in cryopreservation, chronicles method development, and describes relevant literature. The provided detailed information helps practitioners develop and improve methods for desired species. The volume is divided into four parts: I Cryopreservation of Germplasm, II Herbaceous Plants (Barley, celery, chamomile, chicory, garlic, ginseng, hop, horseradish, mint, taro, wasabi), III Woody Species (Coffee, Eucalyptus, guazuma, horse chestnut, neem, olive, poplar, oak, Prunus, Ribes, rose), IV Australian Species. Initially, cryopreservation was driven by the concern for loss of diversity of crops essential for continued improvement of the many plants used for food, health, and shelter. The interest has been expanded by conservationists and their concerns for retaining the diversity of natural populations.

*Protocol for Somatic Embryogenesis in Woody Plants* Shri Mohan Jain, Pramod K. Gupta, 2005-08-26 World population is increasing at an alarming rate, and this has resulted in increasing tremendously the demand for tree products such as wood for construction materials, fuel, and paper, fruits, oils, and medicines, etc. This has put immense pressure on the world's supplies of trees and raw material to industry, and will continue to do so as long as human population continues to grow. Also, the quality of human diet, especially nutritional components, is adversely affected due to limited genetic improvement of most of fruit trees. Thus, there is an immediate need to increase productivity of trees. Improvement has been made through conventional breeding methods; however, conventional breeding is very slow due to the long life cycle of trees. A basic strategy in tree improvement is to capture genetic gain through clonal propagation. Clonal propagation via organogenesis is being used for the production of selected elite individual trees. However, the methods are labour-intensive, costly, and produce low volumes. Genetic gain can now be captured through somatic embryogenesis. Formation of embryos from somatic cells by a process resembling zygotic embryogenesis is one of the most important features of plants. In 1958, Reinert in Germany and Steward in USA independently reported somatic embryogenesis in carrot cultures. Since then, tremendous progress in somatic embryogenesis of woody and non-woody plants has taken place. It offers a potentially large-scale propagation system for superior clones.

**Somatic Embryogenesis in Woody Plants** S.M. Jain, Pramod P.K. Gupta, R.J. Newton, 2013-04-17 The rapid progress

made on somatic embryogenesis and its prospects for potential applications in improving woody plants prompted us to edit this book initially in three volumes and now to add two more volumes. The editors were all convinced that such a treatise was needed and would be extremely useful to researchers and students. This Volume 4 has been divided into three sections and contains 23 chapters. Section A contains eleven chapters covering studies of embryo development and cell biology of white spruce, proliferative somatic embryogenesis in woody species, somatic embryo germination and desiccation tolerance in conifers, performance of conifer somatic seedlings, apoptosis during early somatic embryogenesis, water relation parameters in conifer embryos, image analysis of somatic embryos, somatic embryogenesis in woody legumes, cold storage and cryopreservation and commercialization of plant somatic embryogenesis. Section B contains six chapters dealing with angiosperm woody plants such as somatic embryogenesis in myrtaceous plants *Laurus nobilis*, *Simarouba glauca*, *Magnolia* spp., *Juglans cinerea* and somatic embryogenesis and evaluation of variability in somatic seedlings of *Quercus serrata* by RAPD markers. The chapters contained in Section C are focused on somatic embryogenesis in gymnosperms including *Pinus patula*, *Encephalartos*, *Picea wilsonii*, *Pinus banksiana* hybrid firs and *Taxus*. All the chapters have been peer reviewed and revised accordingly to improve their quality.

*Molecular Biology of Woody Plants* S.M. Jain, S.C. Minocha, 2013-03-09

Woody plants belong to various taxonomic groups which are heterogeneous in morphology, physiology and geographic distribution. Unlike herbaceous plants, they have neither strong evolutionary relationships nor share a common habitat. They are a primary source of fiber and timber and also include many edible fruit species. Their unique phenotypic behavior includes a perennial habit associated with extensive secondary growth. Additional characteristics of woody plants include developmental juvenility and maturity with respect to growth habit, flowering time and morphogenetic response in tissue cultures, environmental control of bud dormancy and flowering cycles, variable tolerance to abiotic stresses, wounding and pathogens and long distance transport of water and nutrients. Woody plants, particularly tree species, have been the focus of numerous physiological studies to understand their specialized functions; however, only recently they have become the target of molecular studies. Recent advances in our understanding of signal transduction pathways for environmental responses in herbaceous plants, including the identification and cloning of genes for proteins involved in signal transduction, should provide useful leads to undertake parallel studies with woody plants. Molecular mapping techniques coupled with the availability of cloned genes from herbaceous plants should provide shortcuts to cloning relevant genes from woody plants. The unique phenotypes of these plants can then be targeted for improvement through genetic engineering.

Somatic Cell Genetics and Molecular Genetics of Trees M.R. Ahuja, Wout Boerjan, David B. Neale, 2012-12-06 This proceedings is based on a joint meeting of the two IUFRO International Union of Forestry Research Organizations Working Parties Somatic Cell Genetics S2 04 07 and Molecular Genetics S2 04 06 held in Gent Belgium 26-30 September 1995 Although a joint meeting of the two Working Parties had been discussed in the past this was the first such meeting that became a successful reality In fact this meeting provided an excellent forum for discussions and interactions in forest biotechnology that encouraged the participants to vote for a next joint meeting In the past decade rapid progress has been made in the somatic cell genetics and molecular genetics of forest trees In order to cover recent developments in the broad area of biotechnology the scientific program of the meeting was divided into several sessions These included somatic embryogenesis regeneration transformation gene expression molecular markers genome mapping and biotic and abiotic

stresses The regeneration of plants produced by organogenesis or somatic embryogenesis is necessary not only for mass cloning of forest trees but also for its application in genetic transformation and molecular biology Although micropropagation has been achieved from juvenile tissues in a number of forest tree species in vitro regeneration from mature trees remains a challenging problem in most hardwoods and conifers The mechanisms involved in the transition from juvenile to mature phase in woody plants are poorly understood This transition can now be investigated at the molecular level *The Woody Plant Seed Manual* United States.
