Hoskins, Ian N. James, 2014-11-17 This book gives a coherent development of the current understanding of the fluid dynamics of the middle latitude atmosphere It is primarily aimed at post graduate and advanced undergraduate level students and does not assume any previous knowledge of fluid mechanics meteorology or atmospheric science The book will be an invaluable resource for any quantitative atmospheric scientist who wishes to increase their understanding of the subject The importance of the rotation of the Earth and the stable stratification of its atmosphere with their implications for the balance of larger scale flows is highlighted throughout Clearly structured throughout the first of three themes deals with the development of the basic equations for an atmosphere on a rotating spherical planet and discusses scale analyses of these equations The second theme explores the importance of rotation and introduces vorticity and potential vorticity as well as turbulence In the third theme the concepts developed in the first two themes are used to

give an understanding of balanced motion in real atmospheric phenomena It starts with quasi geostrophic theory and moves on to linear and nonlinear theories for mid latitude weather systems and their fronts The potential vorticity perspective on weather systems is highlighted with a discussion of the Rossby wave propagation and potential vorticity mixing covered in the final chapter

Hydrometeorology Christopher G. Collier, 2016-08-08 Hydrometeorology presents an introduction to relevant topics in the interdisciplinary fields of hydrology and meteorology This book is one of the few books aiming to provide a balance between aspects of meteorological and hydrological processes The transfer of energy and water between the land surface and lower atmosphere within the hydrological cycle is addressed followed by a description of the nature of precipitation and how it is formed Forecasting precipitation is reviewed on all scales and the range of rainfall runoff models and coastal surge models and forecasts including tsunamis which have been and are being used are discussed The mechanisms of snow ice glacier sea and tundra evaporation and transpiration how drought occurs and the representation of wind are described How rainfall including radar measurements and river flow information is gathered and analysed including frequency analysis Probable Maximum Precipitation and Flood are presented Satellite measurements of precipitation are discussed Examples of major past floods and droughts are given Past and future climate change which is included underpins the importance of hydro meteorological processes The structure of the general circulation of the atmosphere and how it influences weather and climate including the Hadley Ferrel and Polar cells the Trade winds and the El Nino is outlined Finally the influence of urban areas on rainfall formation dealing with urban drainage and air quality are described Each chapter ends with one or two specific points as appendices elements discussed in the chapter and a list of sample problems to aid understanding Readership This book is aimed at 3rd year undergraduate and postgraduate students on hydrology hydrometeorology environmental science and geography courses Professionals in environmental protection agencies and consultancies will also find the book of great interest It contains a balance of both the physics and mathematics which underpin such courses and activities

Dynamics of the Tropical Atmosphere and Oceans Peter J. Webster, 2020-06-08 This book presents a unique and comprehensive view of the fundamental dynamical and thermodynamic principles underlying the large circulations of the coupled ocean atmosphere system Dynamics of The Tropical Atmosphere and Oceans provides a detailed description of macroscale tropical circulation systems such as the monsoon the Hadley and Walker Circulations El Niño and the tropical ocean warm pool These macroscale circulations interact with a myriad of higher frequency systems ranging from convective cloud systems to migrating equatorial waves that attend the low frequency background flow Towards understanding and predicting these circulation systems A comprehensive overview of the dynamics and thermodynamics of large scale tropical atmosphere and oceans is presented using both a reductionist and holistic perspectives of the coupled tropical system The reductionist perspective provides a detailed description of the individual elements of the ocean and atmospheric circulations The physical nature of each component of the tropical circulation such as

the Hadley and Walker circulations the monsoon the incursion of extratropical phenomena into the tropics precipitation distributions equatorial waves and disturbances described in detail The holistic perspective provides a physical description of how the collection of the individual components produces the observed tropical weather and climate How the collective tropical processes determine the tropical circulation and their role in global weather and climate is provided in a series of overlapping theoretical and modelling constructs The structure of the book follows a graduated framework Following a detailed description of tropical phenomenology the reader is introduced to dynamical and thermodynamical constraints that guide the planetary climate and establish a critical role for the tropics Equatorial wave theory is developed for simple and complex background flows including the critical role played by moist processes The manner in which the tropics and the extratropics interact is then described followed by a discussion of the physics behind the subtropical and near equatorial precipitation including arid regions The El Niño phenomena and the monsoon circulations are discussed including their covariance and predictability Finally the changing structure of the tropics is discussed in terms of the extent of the tropical ocean warm pool and its relationship to the intensity of global convection and climate change Dynamics of the Tropical Atmosphere and Oceans is aimed at advanced undergraduate and early career graduate students It also serves as an excellent general reference book for scientists interested in tropical circulations and their relationship with the broader climate system

Atmospheric Frontal Dynamics Mankin Mak, 2017-11-16 Atmospheric Frontal Dynamics is the first book to present a self contained and comprehensive coverage of the ubiquitous surface and upper level fronts which are boundaries separating two air masses of different densities Atmospheric fronts are a product of interaction between planetary synoptic meso and small scales of motions They are uniquely important in weather forecasting since many meteorological phenomena are closely associated with them The discussions of the multifaceted aspects of basic frontal dynamics are based on

illustrative analyses of a hierarchy of semi geostrophic frontal models performed in physical as opposed to geostrophic coordinates Such analyses enable us to systematically and quantitatively delineate the physical nature of different types of fronts in a relatively straightforward manner They are further supplemented by two illustrative analyses using a state of the art model Learning by doing is the guiding principle behind the book making it an asset to both students and instructors in atmospheric science and meteorology
