Atlas of Postmenopausal Osteoporosis Rene Rizzoli, 2011-10-25 Ren Rizzoli Menopause is the time in a woman's life when reproductive capacity ends Ovaries decrease their activity and the production of sex hormones ceases This period may be associated with a large variety of symptoms affecting the cardiovascular and urogenital systems as well as skin hair and bone Bone capital is accumulated by the end of the second decade and remains more or less constant up to the time of menopause Sex hormone deficiency leads to accelerated bone turnover a negative balance and microarchitectural deterioration which compromises bone strength thereby increasing bone fragility and thus fracture risk By the age of 80 it is estimated that 50% of trabecular bone will have been lost Natural menopause occurs between the ages of 45 and 54 years all over the world This age does not appear to have changed significantly over the centuries In contrast since the middle of the 19th century life expectancy particularly in women has increased considerably with most women living to the age of 80 years or more in many

regions of the world This means that at the age of 50 years a woman will live for more than 30 years without bone protection by sex hormones This represents more than one third of a woman's life At the age of 50 years the lifetime risk to experience a fracture is about 50% ie one out of two women will have a fracture during this period *The Endocrine Society's Clinical Endocrinology Update '96 Syllabus* J. Larry Jameson, 1996
