## **Metal Cutting Simulation:**

**SIMULATION OF ORTHOGONAL METAL CUTTING BY FINITE ELEMENT ANALYSIS.** , The aim of this thesis is to compare various simulation models of orthogonal cutting process with each other as well as with various experiments The effects of several process parameters such as friction and separation criterion on the results are analyzed As simulation tool commercial implicit finite element codes MSC Marc Deform2D and the explicit code Thirdwave AdvantEdge are used Separation of chip from the workpiece is achieved either only with continuous remeshing or by erasing elements according to the damage accumulated From the results cutting and thrust forces shear angle chip thickness and contact length between the chip and the rake face of the tool can be estimated For verification of results several cutting experiments are performed at different cutting conditions such as rake angle and feed rate Results show that commercial codes are able to simulate orthogonal cutting operations within reasonable limits Friction is found to be the most critical parameter in the simulation since good agreement can be achieved for individual process variables by tuning it Therefore simulation results must be assessed with all process variables and friction parameter should be tuned according to the shear angle results Plain damage model seems not appropriate for separation purposes of machining simulations On the other hand although remeshing gives good results it leads to the misconception of crack generation at the tip of the tool Therefore a new separation criterion is necessary to achieve both good physical modeling and prediction of process variables *Metal Cutting Simulation of 4340 Steel Using an Accurate Mechanical Description of Material Strength and Fracture* ,1996 Strength and fracture constitutive relationships containing strain rate dependence and thermal softening are important for accurate simulation of metal cutting The mechanical behavior of a hardened 4340 steel was characterized using the von Mises yield function the Mechanical Threshold Stress model and the Johnson Cook fracture model This constitutive description was implemented into the explicit Lagrangian FEM continuum mechanics code EPIC and orthogonal plane strain metal cutting calculations were performed Heat conduction and friction at the toolwork piece interface were included in the simulations These transient calculations were advanced in time until steady state machining behavior force was realized Experimental cutting force data cutting and thrust forces were measured for a planning operation and compared to the calculations 13 refs 6 figs **Finite Element Simulation of Orthogonal Metal Cutting Using an ALE Approach** Abdulfatah Maftah,2008 Simulation of the Structural Effects of Welded Frame Assemblies in Manufacturing Process Chains Loucas Papadakis,2008 Machining J.
