Techniques in Somatic Cell Genetics Jerry W.

Shay, 2013-11-21 Somatic cell genetics is an exciting and rapidly expanding field of research Since descriptions of the major experimental techniques in the field are scattered throughout various journals and other publications there is a real need for a single reference source for both established investigators and students in the field In addition technical reports are frequently abridged such that many researchers are discouraged from attempting to adopt the appropriate methodology This book therefore describes in detail the many recent technical advances in such areas of somatic cell genetics as transfer mediated by liposomes erythrocyte ghosts chromosomes micro cells mito chondria and isolated nuclear DNA These techniques have increased our understanding of the organization and regulation of eukaryotic cells The production of

antibiotic resistant cell lines and their use in studying cytoplasmic inheritance are also included Evidence for the cytoplasmic regulation of nuclear gene expression in eukaryotic cells is rapidly accumulating following the characterization of cytoplasmic mutations The production of nuclear coded mutations their use in standard cell hybridization and recent advances in techniques for fusing whole cells or cell components are also described *American Book Publishing Record Cumulative 1993* R R Bowker Publishing,1994-03 Cited in BCL3 Sheehy and Walford Compiled from the 12 monthly issues of the ABPR this edition of the annual cumulation lists by Dewey sequence some 41 700 titles for books published or distributed in the US Entry information is derived from MARC II tapes and books submitted to R R Bowker and

Vogt,E. Wecker,2012-12-06 Influenza continues to be one of the major epidemic diseases of man and is in fact his only remaining pandemic disease BEVERIDGE 1969 This is largely because influenza virus undergoes extreme antigenic variation the mechanism of which is still poorly understood Two kinds of antigenic variation occur in influenza viruses antigenic drift and major antigenic shifts both involve changes in the hemagglutinin and neuraminidase antigens on the surface of the virus Antigenic drift which involves gradual changes in the surface antigens of influenza virus is thought to result from the selection by an immune population of mutant virus particles with altered antigenic determinants These mutants therefore possess a growth advantage in the presence of antibody FRANCIS and MAASSAB 1965 ARCHETTI and HORSFALL 1950 HAMRE et al 1958 It has been shown that antigenic mutants isolated in vitro by selection with antibody have changes in amino acid sequence in the polypeptides of the hemagglutinin subunits LAVER and WEBSTER 1968 and it is likely that antigenic drift in the neuraminidase occurs by the same mechanism
