Abstract: Research on water quality is a fundamental step in supporting the maintenance of environmental and human health. The elements involved in water quality analysis are multidimensional, because numerous characteristics can be measured simultaneously. This multidimensional character encourages researchers to statistically examine the data generated through multivariate statistical analysis (MSA). The objective of this review was to explore the research on water quality through MSA between the years 2001 and 2020, present in the Web of Science (WoS) database. Annual results, WoS subject categories, conventional journals, most cited publications, keywords, water sample types analyzed, country or territory where the study was conducted and most used multivariate statistical analyses were topics covered. The results demonstrate a considerable increase in research using MSA in water quality studies in the last twenty years, especially in developing countries. River, groundwater and lake were the most studied water sample types. In descending order, principal component analysis (PCA), hierarchical cluster analysis (HCA), factor analysis (FA) and discriminant analysis (DA) were the most used techniques. This review presents relevant information for researchers in choosing the most appropriate methods to analyze water quality data.

1. Introduction

The topic of water has received high visibility and attention on the global sustainability agenda. This is due to increasing pressure from factors such as economic development models, climate change, population growth and public health [1,2]. Sustainable development objective number 6 (SDG6) of the United Nations 2030 Agenda for Sustainable Development is entirely dedicated to water and, in addition to addressing major challenges of universal access to sanitation and water in desirable quantity and quality, presents issues related to water resources management [3].

The analysis, assessment and monitoring of water quality are important tools for water resource management, providing a comprehensive understanding of the state of water [4,5]. Although water quality data at the global level remain sparse, mainly due to the lack of monitoring in less developed countries, there has been a tendency for the generation of these data to increase, via studies that analyze water quality [1,6].

Water quality can be understood as a measure of the suitability of water in relation to natural quality, pollution effects or specific use based on physical, chemical and biological attributes [7]. This measure provides objective evidence that is needed in decision making in water resource management, in the use of water quality monitoring programs [8], in alerting people to ongoing and emerging problems (including chemical and microbial contamination, eutrophication, emerging contaminants, issues related to climate change, among others), in determining compliance with legal standards, in protecting the beneficial uses of water, in the assessment of environmental status, in temporal trends in water quality [9] and in the assessment of the effects on aquatic ecosystems [10].

Association Between Sleep Quality and Aging Joel Ramirez, Kewei Chen, 2024-03-11 With life expectancy on the rise the proportion of people aged 60 or older is projected to account for more than one fifth of the global population by 2050 Sleep quality is one of the most common health concerns that increases with age Changes in sleep patterns associated with old age include disturbed sleep onset an increase in sleep fragmentation more frequent daytime dysfunction and less slow wave sleep than younger adults Sleep is a complex physiological process critical to our health and survival the many functions of sleep range from cerebral metabolic waste clearance and energy conservation to supporting cognitive performance and psychological well being Insufficient sleep has

been linked to an increased risk of developing several chronic conditions including type 2 diabetes cardiovascular disease immunodeficiency chronic pain depression and neurodegenerative diseases such as dementia due to Alzheimer's disease What remains unclear is how variations in sleep quality are related to cognitive performance and how this relationship changes with age with several decades of research on the subject having produced mixed results Despite this much recent evidence indicates a strong relationship between disturbed sleep and accelerated cognitive decline in older adults For example several studies have found that a loss in sleep quality precedes the emergence of cognitive deficits and that sleep disturbances may therefore constitute an early marker of cognitive decline Sleep disturbances also become more extensive with the progression of neurodegenerative diseases which raises questions about the possibility of a bidirectional relationship
