Structure and Reactivity of Metals in Zeolite Materials Joaquín Pérez Pariente, Manuel Sánchez-Sánchez, 2018-09-12 This volume provides the reader with the most up to date and relevant knowledge on the reactivity of metals located in zeolite materials either in framework or extra framework positions and the way it is connected with the nature of the chemical environment provided by the host Since the first report of the isomorphous substitution of titanium in the framework of zeolites giving rise to materials with unusual catalytic properties the incorporation of many other metals have been investigated with the aim for developing catalysts with improved performance in different reactions The continuous expansion of the field both in the variety of metals and zeolite structures has been accompanied by an increasing focus on the relationship between the reactivity of metal centers and their unique chemical environment The concepts covered in this volume are of interest to people working in the field of inorganic and physical chemistry catalysis and chemical engineering but also for those more interested in theoretical approaches to chemical reactivity In particular the volume is useful to postgraduate students conducting research in the design synthesis and catalytic performance of metal containing zeolites in both academic and application contexts

**Nitrosyl Complexes in Inorganic Chemistry, Biochemistry and Medicine II** D. Michael P. Mingos, 2014-06-19 The series Structure and Bonding publishes critical reviews on topics of research concerned with chemical structure and bonding The scope of the series spans the entire Periodic Table and addresses structure and bonding issues associated with all of the elements It also focuses attention on new and developing areas of modern structural and theoretical chemistry such as nanostructures molecular electronics designed molecular solids surfaces metal clusters and supramolecular structures Physical and spectroscopic techniques used to determine examine and model structures fall within the purview of Structure and Bonding to the extent that the focus is on the scientific results obtained and not on specialist information concerning the techniques themselves Issues associated with the development of bonding models and generalizations that illuminate the reactivity pathways and rates of chemical processes are also relevant The individual volumes in the series are thematic The goal of each volume is to give the reader whether at a university or in industry a comprehensive overview of an area where new insights are emerging that are of interest to a larger scientific audience Thus each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years should be presented using selected examples to illustrate the principles discussed A description of the physical basis of the experimental techniques that have been used to provide the primary data may also be appropriate if it has not been covered

in detail elsewhere The coverage need not be exhaustive in data but should rather be conceptual concentrating on the new principles being developed that will allow the reader who is not a specialist in the area covered to understand the data presented Discussion of possible future research directions in the area is welcomed Review articles for the individual volumes are invited by the volume editors Readership research scientists at universities or in industry graduate students Special offer for all customers who have a standing order to the print version of Structure and Bonding we offer free access to the electronic volumes of the Series published in the current year via SpringerLink
