Microvascular Complications Of Diabetes Ecab:

Microvascular Complications of Diabetes - ECAB V Seshiah,2009-09-15 The pathogenesis of microvascular complications is complex and multifactorial Yet hyperglycemia emerges as the most important single cause which has been proved by the Diabetes Control and Complications Trial DCCT Thus the importance of protecting the body from hyperglycemia cannot be overstated the direct and indirect effects on the human vascular tree are the major source of morbidity and mortality in both type 1 and type 2 diabetes Generally the injurious effects of hyperglycemia are separated into macrovascular complications coronary artery disease peripheral arterial disease and stroke and microvascular complications diabetic nephropathy neuropathy and retinopathy It is important for physicians to understand the relationship between diabetes and vascular disease because the prevalence of diabetes continues to increase in our country and the clinical requirements for primary and secondary prevention of these complications are also expanding *Unconventional Organ Damage in Diabetes - ECAB* Samar Banerjee,2012-09-14 Cell health depends on a steady supply of fuel from glucose and free fatty acids Both these major fuels are regulated by insulin Cells in the muscle liver and fat need insulin to receive glucose and hence do not become exposed to high blood glucose levels when the blood sugars are high and insulin levels are low The lack of insulin slows the movement of glucose into these cells and probably spares them from damage when blood sugars are high However other cells such as those in the brain nervous system heart blood vessels and kidneys pick up glucose directly from the blood without using insulin These cells except the brain are more prone to damage from high blood sugars because they become exposed to high internal levels of glucose This to quite an extent explains why damage tends to occur in specific organs such as in nerve and kidney cells and in small blood vessels like those in the eyes This project on the organ damage in diabetes is an attempt to elaborate on the various factors to be considered in managing these patients the pointers for early diagnosis and prevention of the same **Critical Issues and Diabetes - ECAB - E-Book** Samar Banerjee,2014-12-12 **Critical Issues and Diabetes ECAB E Book** **Hotspots in Diabetes - ECAB** Ambady Ramachandran,2013-07-12 Diabetes is one of the most important non communicable lifestyle diseases Diabetes is a multifaceted disorder which possibly influences and impacts body pathophysiology by different mechanisms and in varied ways Diabetes has a very distinguished impact on cardiovascular system and plays a detrimental role in development of cardiovascular disorders Metabolic memory is used to describe the impact of exposure to glucotoxicity lipotoxicity and other metabolic disturbances either as an adverse or a beneficial cell response which determines the later development of vascular complications Terms such as metabolic imprint legacy effect glycemic memory or latent hyperglycemic damage are also used Diabetes has significant impact on different facets of life Diabetes has a distinguished but significant impact on development of various cancers Diabetes has a positive negative and even neutral impact on pathogenesis and progression of cancer depending upon the tumor site On the contrary cancer also has a significant effect on diabetes development and management These facets tend to get overlooked in

the study of diabetes development and management All these aspects are being thoroughly covered in this project so as to facilitate better management of diabetics *Diabetes and Lifestyle* - ECAB Samar Banerjee, 2013-07-12 Diabetes management outcomes and prognosis are majorly affected by the lifestyle exercised by the diabetics Diabetes has significant impact on the different facets of life These facets tend to get overlooked in the management The inter relation of diabetes and marriage sleep travel commute and uneven working hours seem to be trivial part of managing diabetes but are extremely important for a perfect recovery and management of the patient Patients travelling with diabetes need to consider how to adapt their treatment programs to unfamiliar foods irregular schedules and varying amounts of exercise Diabetes will be involved at every step of married life including vacations outings going to the movies as well as intimate moments Sleep and diabetes are interconnected Sleep disorders have a slight but significant impact on diabetes management and it should be focused while attending a diabetic with sleep disorders Shift workers make a special segment of diabetics whose glucose monitoring and control need to be tailored in a special manner With change in circadian rhythm and sleep pattern diabetes management needs to be adjudged and adjusted The main risks that arise in driving from having diabetes are hypoglycemia and the long term complications All these aspects are being thoroughly covered in this book so as to facilitate better management of diabetes *Insulin Resistance* - ECAB Gita Ganguly Mukherjee, 2010-10-26 The insulin resistance syndrome can be defined as insulin resistance compensatory hyperinsulinemia and their associated co morbidities Clinically the term insulin resistance syndrome describes a constellation of abnormalities such as obesity hypertension dyslipidemia type 2 diabetes hyperglycemia and coronary artery disease Insulin is responsible for glucose uptake into the body cells and tissues The response of the cells to insulin varies from individual to individual In some individuals the tissue response to insulin may be diminished This means that even with adequate levels of insulin the glucose uptake into the cells and tissues is not optimal This results in a compensatory over secretion of insulin from the pancreas The persistence of high levels of insulin in the blood or hyperinsulinemia is thought to be responsible for some of the abnormalities associated with this condition However the exact causal association of the condition with these disorders and the pathophysiology of their evolution are unclear The most common underlying mechanism proposed is increased free fatty acids from abdominal fat in individuals with central obesity This leads to deranged insulin signaling reduced muscular glucose uptake increased triglyceride synthesis and hepatic gluconeogenesis A genetic basis of the disease as well as several other factors such as tumor necrosis factor α adiponectin leptin Interleukin 6 and some adipokines have also been implicated Insulin resistance syndrome is of clinical significance because of its association with potentially debilitating conditions that contribute to long term morbidity and even mortality of the individual People with insulin resistance syndrome are at an increased risk of developing type 2 diabetes hypertension dyslipidemia myocardial infarction polycystic ovarian disease and fatty liver In this book we have tried to collate the experiences of the pioneers of this field on the subject and provide the reader a comprehensive view on the topic along

with practical management points which we are sure will benefit the physicians in their clinical practice The contributors have focused on the condition as is prevalent in our subcontinent and have tried to give an insight on the issues pertaining to the same with a topical flavor

Oral Hypoglycemic Agents - ECAB Abdul Hamid Zargar,2009-09-25 Even though we have many advances in the development of oral hypoglycemic agents an ideal drug for treating type 2 diabetes is still a distant reality Today physicians can choose from a variety of medications targeting numerous facets of disease but each drug class poses some limitations The age old molecules such as sulfonylureas and biguanides are still valued because of their well studied mode of action safety tolerability and predictable pharmacodynamic effects This book attempts to describe the historical aspects and advances in the arena of oral hypoglycemic agents extended and sustained release formulations of glipizide and metformin both of which have great promise in the treatment of type 2 diabetes mellitus as well as evaluates the role of the group in diabetic foot infections

Microvascular Disorders In Diabetes Seshiah,2009 Glycemic Monitoring - ECAB Rangasamy V. Jayakumar,2009-03-15 Diabetes is a chronic disease that is reaching an epidemic proportion in many parts of the world Despite the high incidence of diabetes individuals diagnosed with the disorder are only 50% The main challenge of medical professionals in diagnosing and treating the diabetic patients is the lack of understanding of the disease which usually leads to problems with treatment compliance and monitoring There is strong evidence to show that an effective intensive glycemic control reduces various microvascular and neuropathic complications of diabetes mellitus The Diabetes Control and Complications Trial DCCT showed that the intensive glycemic control prevented diabetic complications in type 1 diabetic patients and the HbA1c levels reduced by 1 5 2 0% In the UKPDS study a modest improvement in HbA1c a difference of 0 9 % in the intensively treated group than in the control group brought about a 25% reduction in microvascular complications and a 12% reduction in all diabetes related events There are several methods with differing utilities and limitations existing for monitoring glycemic status in individuals Diabetes care in India leaves much to be desired and suggested and there is a need for efforts to increase awareness of both the patients and the doctors for better treatment and monitoring

Follow-up after Cardiovascular Surgery - ECAB O P Yadava,2013-01-10 Follow up of patients after surgery is of utmost importance as results of the surgery heavily depend on the treatment of patient in the follow up period A good follow up and proper treatment also provides protection to the patient from various complications and recurrence of the disease Therapeutic guidelines and algorithms for treatment of the patients after discharge from the hospitals exist for a number of cardiovascular disorders Still follow up and postdischarge treatment is very often found to be inappropriate and incomplete This results in many avoidable complications for both the patient as well as the treating clinician This book is designed to update the readers on follow up regimens for some of the important cardiovascular surgical procedures Typical supportive case scenarios are included to exemplify and highlight the various points discussed Thus it provides an excellent opportunity to widen one s perspective in this area

Systemic Diseases & Renal Manifestations -

ECAB D S Rana,2012-06-13 This book discusses the epidemiology recognition screening and management of the various common systemic diseases that commonly present with renal manifestations like diabetic nephropathy lupus nephritis hypertension and renal involvement liver disease and dysproteinemias Diabetic nephropathy remains the leading cause of end stage renal disease across the world The outlook for patients who have lupus nephritis has improved in the last decade Kidney disease is common in patients who have advanced liver disease and creatinine based methods do not provide an accurate estimation of renal function in this population Dysproteinemias are associated with protean renal manifestations and renal disease may be the presenting manifestation The authors have given a very comprehensive view pertaining to each topic and have given an insight to their own clinical experiences along with the standard guidelines as followed **Chronic Pancreatitis - ECAB** Pramod Kumar Garg,2010-03-26 Chronic pancreatitis CP is defined as a continuous or recurrent inflammatory disease of the pancreas characterized by progressive and irreversible morphological changes It typically causes pain and permanent impairment of pancreatic function In chronic pancreatitis areas of focal necrosis are typically associated with perilobular and intralobular fibrosis of the parenchyma by stone formation in the pancreatic duct and by the development of pseudocysts Late in the course of the disease a progressive loss of endocrine and exocrine function occurs In the past chronic pancreatitis was considered to be mostly associated with chronic alcohol abuse During the past 2 decades idiopathic chronic pancreatitis and moreover hereditary pancreatitis have been recognized as distinct disease entities Usually the diagnosis is made by a combination of imaging procedures such as ultrasound and endoscopic retrograde cholangiopancreatography and exocrine and endocrine function tests Therapy is presently restricted to symptom control for the lack of a causal treatment strategy Thirty to sixty percent of all patients develop disease associated complications such as persistent pain strictures of the common bile duct or pancreatic duct stones that may require either endoscopic or surgical treatment Chronic pancreatitis is a difficult condition to live with as well as to treat Optimal care needs to be carried out in a multidisciplinary environment that can address both the physical and psychological aspects of the disease It is commonly seen in alcohol dependent individuals but many other groups of individuals suffer with irreversible inflammatory destruction of the pancreas Abdominal pain is the predominant feature and pain specialists are an important part of any pancreatic team Exocrine and endocrine failure are addressed by appropriate nutrition with supplements and insulin whilst the complications that are seen over time may require a combination of endoscopic and surgical treatment This clinical update has been designed to update the readers on the important aspects of CP The book has stressed upon various aspects of the condition like the etiology pathogenesis diagnosis and evaluation along with an insight into the management approach of the patient Supportive case scenarios have also been incorporated with relevance to the topics covered under the book Overall the book presents to the readers an excellent compilation of clinically applicable literature sourced from the most acclaimed physicians in the country **Insulins in Diabetes - ECAB** Rangasamy V. Jayakumar,2012-07-05 Decision making in

instituting insulin therapy is an important aspect of diabetes management The appropriate insulin regimen for an individual patient should take into account the patient's lifestyle age motivation general health self management skills and treatment goals In addition a discussion of the newer insulins versus older insulin is a much desired topic in the Indian context Another area of interest is the insulin delivery mechanism in the intensive care units in hospital settings This CME module is designed to address such questions with supportive typical clinical scenarios with which all readers will be able to identify Thus it provides an excellent opportunity to widen one's perspective in this area

Diabetic Kidney Disease - ECAB K V

Dakshinamurthy, 2013-07-22 The prevalence of Diabetes Mellitus is increasing rapidly all over the world and more so in the developing countries The global burden of diabetes is expected to double between 2000 and 2030 with the greatest increases in prevalence occurring in the Middle East sub Saharan Africa and India Moreover the development of type 2 diabetes during the childbearing years is also likely to increase primarily in the developing countries It has already been established that Diabetes is the most common primary cause leading to end stage renal disease ESRD and Diabetic Nephropathy is the leading cause of chronic kidney disease CKD in India The cornerstones of management of Diabetic Kidney Diseases include early diagnosis of diabetic nephropathy prevention of its progression and treatment of the co morbid conditions Substantial under diagnosis of both diabetes and chronic kidney disease leads to lost opportunities for prevention An inadequate or inappropriate care of patients with diabetic kidney disease contributes to disease progression eventually up to a stage that requires renal replacement therapy which is not a feasible option for many on a long term basis especially in a developing country like ours This book covers various aspects of diabetic kidney disease in detail and attempts to familiarize the reader with the existing aspects of the conditions as well as touch upon the new advances in the field The first chapter outlines the extent to which the condition affects the population globally as well as in our country The second chapter explores the underlying mechanism by which the disease starts and progresses and the pathological markers of the same The third chapter delineates the clinical and diagnostic markers of the condition The fourth and fifth chapters speak of the non diabetic glomerular and non glomerular diseases in diabetics The sixth chapter addresses the most important and desirable goal of preventing the progression and ideally the onset of the disease The seventh chapter puts together the various treatment modalities available and the subsequent chapter explores the management options for cases requiring renal replacement In addition to the emphasis to Indian literature at the end of each chapter the ninth chapter is specially included to highlight the salient aspects of this condition from the Indian perspective This book will be beneficial not only for the nephrologists but also for the epidemiologists medical students diabetologists and every doctor who deals with diabetes mellitus

Lipids in Diabetes - ECAB S V Madhu, 2013-07-23 Type 2 diabetes mellitus is associated with a greater risk of developing atherosclerotic macrovascular diseases like myocardial infarction stroke and peripheral vascular disease There is 2 to 4 fold increased risk of atherosclerotic heart disease and stroke in diabetic patients compared to non diabetic patients As the

prevalence of type 2 diabetes is increasing rapidly this diabetes related atherosclerotic disease is predicted to be a major public health problem Atherosclerosis is a complex process and in diabetic patients it behaves differently with increased lesion progression and severity This accelerated atherosclerotic process in diabetics is explained on the basis of several risk factors like hyperglycemia dyslipidemia accelerated formation of advanced glycation end products increased oxidative stress and genetic factors It is difficult to establish precisely the elements responsible for this atherosclerosis in diabetics but by epidemiological clinical and by animal studies it has been possible to get an idea of this problem in diabetics Of the several risk factors for atherosclerosis in diabetes dyslipidemia is the leading one and an insight into the pathophysiologic relation of isolated triglyceridemia in Indian diabetics with the identification of the targets for control of lipids in diabetes practical vs ideal needs to be well understood by the treating physician This book is designed to address such issues with supportive typical clinical scenarios with which the readers will be able to identify Thus it provides an excellent opportunity to widen one's perspective in this area

Diabetic Foot - ECAB Arun Bal, 2012-07-05 Of all lower extremity amputations 40-70% are related to diabetes In most studies the incidence of lower leg amputation is estimated to be 5-25/100 000 inhabitants year among people with diabetes the number is 6-8/1 000 Lower extremity amputations are usually preceded by a foot ulcer in people with diabetes The most important factors related to the development of these ulcers are peripheral neuropathy foot deformities minor foot trauma and peripheral vascular disease The spectrum of foot lesions varies in different regions of the world due to differences in socioeconomic conditions standards of foot care and quality of footwear This clinical update is designed to address this condition in a comprehensive way to help the reader take important questions while managing the patient with supportive typical clinical scenarios with which all readers will be able to identify Thus it provides an excellent opportunity to widen one's perspective in this area

Infections in Diabetes - ECAB Samar Banerjee, 2012-07-05 Patients with diabetes are predisposed to infections The risk ratio for infectious disease related hospitalization for diabetic versus nondiabetic persons is more than 2 and almost 2 for death attributable to infection Infections in diabetes may precipitate metabolic derangements and conversely the metabolic derangements of diabetes may facilitate infection Abnormalities in the microvascular circulation of individuals with diabetes may result in decreased tissue perfusion which facilitates the acquisition of infection and impairs response to therapy The incidence of TB among diabetic patients is 2-5 times higher when compared to the general population which recently has raised the concern that a combination of DM and HIV infection might lead to a further increased incidence of TB in India and in other developing nations However it is unclear whether diabetes is an independent risk for common upper and lower respiratory tract infections Urinary tract is also reported to be the most prevalent site of infection in patients with diabetes These infections are known to account for a relatively smaller percentage of reported patients probably due to the fact that most patients including diabetics with urinary tract infection are treated as outpatients A number of long term effects of diabetes mellitus on the genitourinary system predispose diabetic

patients to bacterial urinary tract infections In addition complications of urinary tract infection e g bacteremia renal abscesses and renal papillary necrosis are more common in patients with than without diabetes Rhinocerebral mucormycosis and emphysematous pyelonephritis are some of the less commonly reported conditions seen in diabetics though being important pathologies The primary goal of this book is to provide a high quality evidence based text on the various aspects of the associations of various infections in diabetics with prime focus on TB and diabetes rare conditions such as rhinocerebral mucormycosis and emphysematous pyelonephritis and also the various acute infections commonly reported in the condition The book includes in depth analysis of the diagnostic and management issues considering the same **Dietary**

Considerations in Diabetes - ECAB Anoop Misra,2012-07-05 Diet plays an important role in the treatment of diabetes alone or in combination with insulin or oral hypoglycemic drugs The diabetic nutrition plan of an individual necessitates to be based upon excepting the usual parameters his her socioeconomic status ethnicity religion and local food habits It is important that diet plan is individualized and also region based Since there are a number of artificial sweeteners available now it is necessary that physicians should take in account scientific data while prescribing any artificial sweetener This issue in the ECAB Update Series Diabetology reviews these issues in accordance with the Indian Dietary habits and available evidence to support the clinical decisions *ECAB Diabetes and Exocrine pancreas - E-Book* A.G. Unnikrishnan,2014-12-11 ECAB Diabetes and Exocrine pancreas E Book ECAB clinical update Diabetology Mar-April Issue2 Dr. Zargar,
