Vibration Fatigue by Spectral Methods Janko Slavič, Miha Boltezar, Matjaz Msrnik, Martin Cesnik, Jaka Javh, 2020-08-20
Vibration Fatigue by Spectral Methods relates the structural dynamics theory to the high cycle vibration fatigue. The book begins with structural dynamics theory and relates the uniaxial and multiaxial vibration fatigue to the underlying structural dynamics and signal processing theory. Organized in two parts, part I gives the theoretical background and part II the selected experimental research. The time and frequency domain aspects of signal processing in general related to structural dynamics and counting methods are covered in detail. It also covers all the underlying theory in structural dynamics signal processing uniaxial including non Gaussianity and non stationarity. Finally it provides the latest research on multiaxial vibration fatigue and the non stationarity and non Gaussianity effects. This book is for engineers, graduate students, researchers and industry professionals working in the field of structural durability under random loading and vibrations and also those dealing with fatigue of materials and constructions. Introduces generalized structural dynamics theory of multiaxial vibration fatigue. Maximizes understanding of structural dynamics theory in relation to frequency domain fatigue. Illustrates connections between experimental work and theory with case studies, cross referencing and parallels to accelerated vibration testing.

Physics and Mechanics of New Materials and Their Applications Ivan A. Parinov, Shun-Hsyung Chang, Yun-Hae Kim, Nao-Aki Noda, 2021-08-10
This book presents selected peer reviewed contributions from the 2020 International Conference on Physics and Mechanics of New Materials and Their Applications PHENMA 2020 26-29 March 2021 Kitakyushu Japan focusing on processing techniques, physics, mechanics and applications of advanced materials. The book describes a broad spectrum of promising nanostructures, crystal structures, materials and composites with unique properties. It presents nanotechnological design approaches, environmental friendly processing techniques and physicochemical as well as mechanical studies of advanced materials. The selected contributions describe recent progress in computational materials science methods and algorithms in particular finite element and finite difference modelling applied to various technological, mechanical and physical problems. The presented results are important for ongoing efforts concerning the theory, modelling and testing of advanced materials. Other results are devoted to promising devices with higher accuracy, increased longevity and greater potential to work effectively under critical temperatures, high pressure and in aggressive environments.
