Abstract. Understanding the role mental representations play within the process of meaning structure comes with the understanding of the relationship between verbal semantics and predicate argument structures. While fulfilling a specific linguistic function, predicate argument structures also allow for the organization of more general information of extra-linguistic and perceptual nature. Previous research suggests that the development of linguistic competence cannot happen without bringing into play such general world knowledge, given that concepts get linked to elements of the perceptive world. Our research studies the role mental representations play within the process of meaning structure. To trigger some food for thoughts on a new model of meaning structure we discuss the results of our experimental study on the inter-modality image-text and we analyze the collected data under the perspective of Vygotsky's non-classical psychology, which implies a philosophical understanding of holography.

Keywords: representation, predicate argument structures, perception, meaning structure, holography.

1 Introduction

Our approach to meaning structure goes beyond conceiving it simply in terms of bringing together linguistic forms and shapes. Needless to say, morphology, syntax, semantics, and pragmatics, contribute to such a process, yet there is more to the alchemy of communication and understanding that needs to be uncovered. Although some issues about meaning structure may be hard to pin down, others come with a sense of immediacy and demand attention. This paper contends that, if the process of meaning structure is to be understood in terms of "putting the pieces together" then, investigating (a) what is the nature of such pieces, and whether (b) there is a "who," in charge of putting the pieces together, as well as (c) where is "who" to be found, needs to be addressed. Doing so also implies looking for "the situation" allowing for the pieces to come together while comprehending what is "the nature of the situation" that triggers such a process.

Goffinet, Pasko Rakic, 2012-08-10 Our understanding of the molecular mechanisms involved in mammalian brain development remains limited However the last few years have witnessed a quantum leap in our knowledge due to technological improvements particularly in molecular genetics Despite this progress the available body of data remains mostly phenomenological and reveals very little about the grammar that organizes the molecular dictionary to articulate a phenotype Nevertheless the recent progress in genetics will allow us to contemplate for the first time the integration of observation into a coherent view of brain development Clearly this may be a major challenge for the next century and arguably is the most important task of contemporary developmental biology The purpose of the present book is to provide an overview that synthesizes up to date information on selected aspects of mouse brain development Given the format it was not possible to cover all aspects of brain development and many important subjects are missing The selected themes are to a certain extent subjective and reflect the interests of the contributing authors Examples of major themes that are not covered are peripheral nervous system development including myelination the development of the hippocampus and several other CNS structures as well as the developmental function of some important morphoregulatory molecules **The Reeler Mouse as a Model of Brain Development** Catherine Lambert de Rouvroit, Andre M.
