Innovations and Platforms Kotsopoulos, Stavros, Ioannou, Konstantinos, 2008-10-31 This book presents state of the art research developments and integration activities in combined platforms of heterogeneous wireless networks Provided by publisher Next-Generation Passive Optical Networks Ahmad R. Dhaini, 2008 Research and development on optical networks generally and on Passive Optical Networks PON particularly have matured considerably The exponential increase in the demand for bandwidth has exposed many challenges in the last mile that remains the bottleneck in broadband access networks Currently Ethernet PON has emerged as the most inexpensive panacea providing more bandwidth than Cable Modems and Digital Subscriber Lines Nevertheless providing fair and efficient Quality of Service QoS has always been a major issue due to the un deterministic nature of Time Division Multiple Access TDMA technology and the limited 1 Gbps channel speed that EPON relies on unlike backbone networks that uses the Wavelength Division Multiplexing WDM technology This book instruments these challenges and issues and offers effective solutions More specifically it presents an upgrade from a TDM PON to a Hybrid TDM WDM PON and proposes and validates the first framework that enables for per

stream QoS protection in EPON using a new fair QoS scheduler The book addresses professionals in optical and access networks It is also directed towards researchers who would like to get a novel fragrance of EPONs Long Reach Passive Optical Networks Huan Song, 2009 With the advances in optical technology the span of a broadband access network using Passive Optical Network PON technology can be increased from today's standard of 20 km to 100 km or higher Such an extended reach PON is known as Long Reach PON LR PON This technology can enable broadband access for a large number of customers in the access metro area while decreasing capital and operational expenditures for the network operator Therefore it is very desirable to comprehensively investigate this technology for future broadband access This dissertation is dedicated to the research of architecture management and reliability of LR PON This dissertation first reviews the evolutionary path of access networks and shows the drivers from technology and business perspectives for high bandwidth and low cost A variety of research challenges in this field is reviewed from optical components in the physical layer to the control and management issues in the upper layers We discuss the requisites for optical sources optical amplifiers and optical receivers in optical access networks with high transmission rate 10 Gbps and large power attenuation due to large split transmission over 100 km and beyond and propagation We analyze the key topological structures to guarantee physical protection e.g. tree and branch ring and spur Then some relevant demonstrations of Long Reach optical access networks developed worldwide by different research institutes are presented A major challenge in LR PON is that the propagation delay for data as well as control signals between the telecom central office CO and the end user is increased by a very significant amount Now traditional PON algorithms for scheduling the upstream transmission such as dynamic bandwidth allocation DBA algorithms may not be sufficient actually they may lead to degraded performance because of the long delay of the CO to Users control loop This challenge motivates us to propose and study a multi thread polling algorithm to effectively and fairly distribute the upstream bandwidth dynamically This algorithm exploits the benefits of having multiple polling processes running simultaneously and enabling users to send bandwidth requests before receiving acknowledgement from the CO We compare the proposed algorithm with traditional DBA and show its advantage on average packet delay With the increased bandwidth requests from the expanding base of users LR PON should utilize the network resource e.g. wavelengths lasers etc more effectively We propose a new and efficient protocol to achieve better utilization of tunable lasers as well as wavelength resources across different user groups in LR PON In order to accommodate downstream bursty traffic and provide Quality of Service QoS in the user specified Service Level Agreements SLA the protocol integrates our proposed SLA aware bandwidth allocation scheme based on flow scheduling We show the protocol's advantage to support incremental upgrade of bandwidth with increasing user bandwidth requests and to provide a user with a SLA which guarantees a number of streaming flows with average bandwidth and maximum delay guarantee e.g. 5 ms as well as data flows with average bandwidth specifications Since LR PON serves a lot more users a network failure may lead to a huge amount of data loss and

negative user experience Thus to understand the importance of LR PON survivability we propose hardware accelerated protection schemes for the LR PON incorporating the ring and spur structure to achieve fast protection switching time and automatic failure location at the Optical Line Terminal OLT which is located at the head end of the optical access network We design the protection schemes for multiple network environments e g unidirectional transmission vs bidirectional transmission and 1:1 protection vs 1:N protection The numerical examples demonstrate that protection paths can be established within a few tens of ms after a failure occurs This dissertation makes important contributions by studying novel architectures protocols and algorithms of LR PON that will help to improve the next generation telecom access networks

Analysis of the Performances and Tolerances of the 2nd Generation Passive Optical Networks (NG-PON2) for FTTH Systems Juan Camilo Velásquez Micóltá, 2014 ENGLISH In a Fiber to the Home FTTH system the fiber is

connected until the household users A passive optical network PON is a particular type of FTTH networks that uses P2MP point to multipoint fiber premises in which unpowered optical splitters are used to share part of the infrastructure enable a single optical fiber to serve multiple premises The evolution of PON systems across the years can be associated with the evolution in multiplexing technologies In the first years with the use of TDM the achieved upstream and downstream aggregate bandwidth was in the order of 155 Mbit/s until 10 Gbit/s in XG-PON standard But with the implementation of WDM the capacities have been increased significantly until get bandwidths of 250 Gbit/s and 500 Gbit/s using WDM with coherent detection This new standards use advanced modulation and codification formats This project will evaluate the new international standard ITU-T G.989 for next generation optical fiber access to the home FTTH network operating at 4x 10Gbit/s that uses time multiplexing and dense wavelength multiplexing TWDM The key commercial devices for its implementation will be identified and modelled Next the access network will be built in a computer simulator different tests will be run and the system will be optimized Tasks Study of the state of art of optical access networks comparing different technologies devices and architectures Analysis of the new international standard ITU-T G.989 to review the optical spectrum management devices and subsystems proposed Use of VPI simulator in order to build an access network architecture and realize different tests linking it with MATLAB to analyze the achieved results Optimization of the network built

Supporting Diverse Customers and Prioritized Traffic in Next-generation Passive Optical Networks Naureen Hoque, 2018 The already high demand for more bandwidth usage has been growing rapidly Access network traffic is usually bursty in nature and the present traffic trend is mostly video dominant This motivates the need for higher transmission rates in the system At the same time the deployment costs and maintenance expenditures have to be reasonable Therefore Passive Optical Networks PON are considered promising next generation access technologies As the existing PON standards are not suitable to support future PON services and applications the FSAN Full Service Access Network group and the ITU-T Telecommunication Standardization Sector of the International Telecommunication Union have worked on developing the NG-PON2 Next Generation PON 2 standard Resource allocation is a fundamental task in any PON and it is necessary to have an efficient scheme that reduces delay maximizes bandwidth usage and minimizes the resource wastage A variety of DBA Dynamic Bandwidth Allocation and DWBA Dynamic Wavelength and Bandwidth Allocation algorithms have been proposed which are based on different PONs e.g. EPON GPON XG-PON 10G-EPON etc But to our knowledge no DWBA scheme for NG-PON2 system with diverse customers and prioritized traffic has been proposed yet In this work this problem is addressed and five different dynamic wavelength and bandwidth allocation DWBA schemes are proposed First mixed integer linear programming MILP models are developed to minimize the total delay of the high priority data Due to the MILP's high computational complexity heuristic algorithms are developed based on the MILP model insights The five heuristics algorithms are No Block Split Heuristic NBH Equal Block Split Heuristic EBH Priority Based No Block Split Heuristic PNBH

Priority Based Equal Block Split Heuristic P EBH and Priority Based Decider Block Split Heuristic P DBH Six priority classes of requests are introduced with the goal of minimizing the total delay for the high priority data and to lessen the bandwidth wastage of the system Finally experiments for the performance evaluation of the five DWBA schemes are conducted The results show that P NBH P EBH P DBH schemes show a 47 63% less delay and 30% of less bandwidth wastage on average for the highest priority data transmission than the schemes without priority support NBH and EBH Among these five schemes NBH method has the highest delay whereas EBH and P EBH waste more bandwidth than the other schemes P DBH is the most efficient among the five because this scheme offers the lowest delay for high priority data and the minimum bandwidth wastage for lower priority ones

She-Hwa Yen, 2011 Fiber based access is recognized as the most promising technology for solving broadband bandwidth bottlenecks Time division multiplexing passive optical networks TDM PONs that are passive and non reconfigurable are currently the most widely deployed type of fiber access networks However due to their passive nature TDM PONs faces several limitations such as inflexible service area coverage lack of intelligence for control and inability to counteract security attacks In order to address the current limitations of optical access networks we propose reconfigurable technologies for next generation PONs Two novel reconfigurable technologies are proposed analyzed and experimentally evaluated The first solution is a reconfigurable power and wavelength assignment technology based on a novel non volatile reconfiguration node The proposed remote node can reconfigure the network to adapt it to varying degrees of deployment conditions and or network attacks Moreover the proposed remote node incorporates a novel quasi passive device that does not consume energy once it is reconfigured into a new latching state Therefore the proposed remote node has very low energy consumption and does not require local power supply to preserve the passive character of the distribution network In particular two novel quasi passive optical power splitter technologies based on Micro Electro Mechanical Systems MEMS and transition metal oxide have been designed for the reconfigurable device A simulation study shows the proposed reconfigurable device would outperform traditional passive splitter in terms of maximum number of supportable users under realistic deployment conditions The second solution addresses the issue of reconfigurable network consolidation and infrastructure simplification Current TDM PONs suffers from limited reach and split ratio To enhance the performance in terms of service range and quality of service reconfigurable network consolidation is a promising solution It can also simplify the network and reduce cost We propose the following novel reconfigurable technologies for consolidation and simplification of next generation access networks 1 Passive reach extension technology for the drop section of optical access networks 2 Sleep mode ONUs for energy saving 3 Centrally managed optical signature that can monitor and protect the upstream link and 4 Multi rate burst mode receivers These reconfigurable technologies can bring the intelligence into optical access networks and improve the efficiency and flexibility for next generation optical access networks **The ComSoc Guide to Passive Optical Networks**
