MICROBIOLOGICAL TECHNIQUES N. Murugalatha, Lali Growther, J. Vimalin Hena, N. Hema Shenpagam, R. Anitha, D. Kanchana Devi, G. Rajalakshmi, CONTENTS 1 Introduction to Microbiology 2 Tools of Microbiology 3 Fundamentals of

Microbiology 4 Microbial Physiology 5 Industrial Microbiology 6 Environmental Microbiology 7 Food Microbiology 8 Genetics 9 Immunology 10 Medical Microbiology 11 Biochemical Methodology 12 Virology PREFACE Microbiological Techniques is designed for the students to explore the world of microorganisms and how the process of scientific discovery is carried out with an ease The study of microbiology is dynamic because of the ubiquitous nature of the microbes and the variability inherent in every living organism The broad nature of the subject and diversity of topics from the fundamentals to its unique fields can make the way of presentation a little difficult but it is also a part of what makes microbiology an interesting and challenging subject The book primarily focuses on the basic microbiological techniques with applications for undergraduate and postgraduate students in diverse area of biological techniques This book is the outcome of nearly a decade of teaching and research experience The manual comprises twelve parts in which exercises in first three parts provide sequential developments of fundamental techniques The remaining exercises are as independent as possible to allow the instructor to select the desirable sequence Exercises are pursued in a normal scale providing maximum details so that one can perform the experiment independently and safely The style and simplicity of expression have been our twin objectives All exercises have been thoroughly tested in our laboratory by our students with wide variety of real talents and enthusiasm

Biotechnology K. M. Thara, 2009-01-15 Biotechnology laboratory manual provides basic protocols required for students of undergraduate and postgraduate programme The protocols are explained in a simplified manner and are very easy to conduct The book is a collection of experiments from all fields of biotechnology and will become a companion for all those who do research in the field of biotechnology Attention is given to include most of the basic protocols This book will provide first hand valuable information for all those who are interested in biotechnology research *Introductory Microbiology-I* Dr.R Krishna Murthy, The book *Introductory Microbiology* consists of nine chapters covering all the basics required for the beginners in microbiology The first chapter *Introduction to Microbiology* gives a brief insight of the historical development of microbiology pioneers in microbiology developments and various branches of microbiology and scope of microbiology As microorganisms are ubiquitous in distribution a need for the study of microbial techniques for the proper identification of microorganisms to scientists involved in applied research and industry for their exploitation The author describes the various isolation and enumeration techniques of microorganisms in the second chapter *Isolation and Enumeration of Microorganisms* The author describes the stains its types and various staining methods in the third chapter *Staining Techniques* for the easy identification of various bacteria as they are quite colourless transparent and have a refractive index of the aqueous fluids wherein they re suspended Microorganisms are too small nanometers to micrometers to be seen by our unaided eyes and therefore the microscopes are of crucial importance to view the microbes Hence the author in the fourth chapter *Microscopy* have described the metric units properties of light basic quality parameters of microscopic image the components of various light and electron microscopes with reference to their working principles and limitations The never techniques in microscopy

such as confocal fluorescence confocal scanning probe and atomic force microscope and application have also been described. Microbial cells are structurally complex, perform numerous functions and have a need for carbon energy and electrons to construct new cellular components and do cellular work. Hence, microorganisms should have a constant supply of nutrients and a source of energy which are ultimately derived from the organism's environment. The author in this fifth chapter, Microbial Nutrition, describes the basic common nutrients required for the microbial growth, nutritional types of microorganisms, nutritional and physical requirements of microbial growth and the various nutrient uptake mechanisms with a special emphasis on the passive and active transport, group translocation and Iron uptake. Culture is an in vitro technique of growing or cultivating microorganisms or only other cells in a suitable nutrients medium called a culture medium in the laboratory. A culture medium is a solid or liquid preparation used to grow, transport and store microorganisms. Different microorganisms require different nutrient materials. All the microbiological studies depend on the ability to grow and maintain microorganisms in the laboratory which is possible only if suitable culture media are available. The author in the sixth chapter, Culture media and methods, has described the historical perspective of the culture medium, important factors for cultivation, common ingredients of a culture medium, classification of culture media based on consistency, nutritional component and functional use. Special culture techniques and some of the commonly used laboratory media have been briefly described. People have been practicing disinfection and sterilization unknowingly since time immemorial though the existence of microorganisms was unknown. The complete destruction or removal of all living microorganisms or their spores by any physical, chemical or mechanical means is called sterilization. Sterilization can be accomplished by using heat, filtration and gases. A satisfactory sterilization process is designed to ensure a high probability of achieving sterility. The author in the seventh chapter, Sterilization, has described the basic principles of sterilization, factors influencing the effectiveness of antimicrobial agents, various physical and chemical agents and other agents of sterilization. Strain development is a primary step in the process of fermentation or growth studies carried out in any fermentation process or microbiological research which enables to increase the population of microorganisms from stock culture to obtain cells in an active and exponential growth phase. The author in the eighth chapter, Strain development and improvement, has described the historical perspective of fermentation with reference to brewing and bakers yeast, development of inoculum for bacteria and fungi. He has described the conventional, Metagenomics, genetic engineering and mutation selection and latest strain improvement methods such as the genomic transcriptome, proteomic and metabolome analysis. Microbial culture preservation aims at maintaining a microbial strain alive, uncontaminated without variation or mutation. The author in the ninth chapter, Culture Preservation, describes the relevance of various culture preservation techniques with the objective of maintaining live strains uncontaminated and to prevent change in their characteristics.
