aspects of microalgae processing for biofuel chemicals pharmaceuticals and bioplastics Advances in Carbon Management Technologies Subhas K. Sikdar, Frank Princiotta, 2021-01-31 Volume 2 of Advances in Carbon Management Technologies has 21 chapters It presents the introductory chapter again for framing the challenges that confront the proposed solutions discussed in this volume Section 4 presents various ways biomass and biomass wastes can be manipulated to provide a low carbon footprint of the generation of power heat and co products and of recovery and reuse of biomass wastes for beneficial purposes Section 5 provides potential carbon management solutions in urban and manufacturing environments This section also provides state of the art of battery technologies for the transportation sector The chapters in section 6 deals with electricity and the grid and how decarbonization can be practiced in the electricity sector The overall topic of advances in carbon management is too broad to be covered in a book of this size It was not intended to cover every possible aspect that is relevant to the topic Attempts were made however to highlight the most important issues of decarbonization from technological viewpoints Over the years carbon intensity of products and processes has decreased but the proportion of energy derived from fossil fuels has been stubbornly stuck at about 80% This has occurred despite very rapid development of renewable fuels because at the same time the use of fossil fuels has also increased Thus the challenges are truly daunting It is hoped that the technology choices provided here will show the myriad ways that solutions will evolve While policy decisions are the driving forces for technology development the book was not designed to cover policy solutions

Biodiesel: Feedstocks, Technologies, Economics and Barriers Armen B. Avagyan, Bhaskar Singh, 2019-05-07

Air pollution policy is closely connected with climate change public health energy transport trade and agriculture and generally speaking the Earth has been pushed to the brink and the damage is becoming increasingly obvious The transport sector remains a foremost source of air pollutants a fact that has stimulated the production of biofuels This book focuses on the biodiesel industry and proposes a modification of the entire manufacturing chain that would pave the way for further improvements Oil derived from oilseed plantations crops is the most commonly used feedstock for the production of biodiesel At the same time the UK's Royal Academy of Engineering and 178 scientists in the Netherlands have determined that some biofuels such as diesel produced from food crops have led to more emissions than those produced by fossil fuels Accordingly this book re-evaluates the full cycle of biodiesel production in order to help find optimal solutions It confirms that the production and use of fertilizers for the cultivation of crop feedstocks generate considerably more GHG emissions compared to the mitigation achieved by using biodiesel To address this fertilization challenge projecting future biofuel development requires a scenario in which producers shift to an organic agriculture approach that includes the use of microalgae Among advanced biofuels algae's advantages as a feedstock include the highest conversion of solar energy and the ability to absorb CO₂ and pollutants as such it is the better choice for future fuels With regard to the question of why algae's benefits have not been capitalized on for biofuel production our analyses indicate that the sole main barrier to realizing algae's biofuel potential is ineffective international and governmental policies which create

difficulties in reconciling the goals of economic development and environmental protection *Fundamentals of Biocatalysts*
F. Xavier Malcata, 2025-02-07 This textbook covers the essentials of cells as biocatalysts including cell morphology cell genetics cell metabolism cell operation cell stoichiometry cell engineering and cell interaction A pragmatic and systematic approach is provided to all such topics from the point of view of a biological engineer illustrated by criteriously selected and carefully solved problems proposed at the end of each section In the first part of this textbook readers will find a brief historical review of biotechnology and in the second part the author explores the performance of biocatalysts in terms of native features and upon rational manipulation thereof Whenever appropriate mathematical derivations are put forward that are easy to follow step by step even by students holding only elementary mathematical and biochemical backgrounds and are developed at a pace suitable for self learning Furthermore the functional forms and meanings of the expressions produced are explored and the final germane formulae are duly highlighted and graphically interpreted in dimensionless form to facilitate the perception of major trends and asymptotic patterns Therefore this book offers a valuable resource for both instructors and undergraduate graduate students as an aid to grasp and relate basic concepts dealing with living cells as catalysts designed for bioreactors rather than engaging in cumbersome descriptions of their physiological behaviour This textbook together with the companion volumes *Operation Fundamentals in Bioreactor Engineering* and *Modelling Fundamentals in Bioreactor Engineering* fill the gap between qualitative approaches focused on biochemistry and technological approaches which often resort to empirical correlations unlikely to support a fundamental understanding of the essential concepts
