

NUCLEAR FORENSICS AS NUCLEAR MATERIAL ANALYSIS FOR SECURITY PURPOSES

VITALY FEDCHENKO

INTRODUCTION

The discipline of nuclear forensic science (or nuclear forensics) has been firmly associated with combating illicit trafficking of nuclear or other radioactive materials (NORM).¹ In its broadest sense, illicit trafficking refers to criminal or unauthorized acts involving NORM outside of regulatory control, such as their 'import, export, possession, sale, delivery, movement, use, storage, disposal or transfer'.² The more colloquial term of 'nuclear smuggling' is also used to describe the same phenomenon, especially where nuclear materials suitable for the manufacture of nuclear explosive devices are concerned.

Illicit trafficking is a threat that is meant to be addressed by nuclear security, which is the complex of laws, regulations, institutions, systems and measures aimed at the 'prevention of, detection of, and response to, criminal or intentional unauthorized acts involving or directed at nuclear material, other radioactive material, associated facilities, or associated activities'.³ Even though it is not stated directly in the above-mentioned definitions, both nuclear security and illicit trafficking imply that the perpetrators

SUMMARY

Nuclear forensic science is normally seen as a discipline pertinent to nuclear security and intended to support investigations of illicit trafficking or nuclear terrorism cases. This view, while certainly correct in most cases, may be worth revisiting at a time when the process of the Nuclear Security Summits is over, and when the political support for nuclear security may diminish in the future in at least some key states.

Nuclear smuggling was happening before nuclear security was formally defined as a discipline, and nuclear material analysis and data interpretation techniques employed by nuclear forensic science have also been used to investigate cases not pertinent to illicit trafficking.

An argument can be made that nuclear forensics would benefit from taking stock of its roots and considering an expansion of its scope or improved awareness of and collaboration with other frameworks, such as verification of non-proliferation and disarmament treaties. The consolidation of various dimensions of nuclear forensics—or of nuclear material analysis for security purposes—would cut costs and provide new and possibly unexpected synergies between different applications.

This paper provides some background to that discussion and describes European contributions to the development of nuclear forensics as a discipline.

ABOUT THE AUTHOR

Vitaly Fedchenko (Russia) is a Senior Researcher in SIPRI's European Security Programme, responsible for nuclear security issues and the political, technological and educational dimensions of nuclear arms control and non-proliferation. He is the author or co-author of several publications on nuclear security, nuclear forensic analysis and treaty verification.

¹ According to the most recent IAEA definition, the terms 'nuclear forensic science' and 'nuclear forensics' are interchangeable and are defined as the 'discipline of forensic science involving the examination of nuclear and other radioactive material, or of other evidence that is contaminated with radionuclides, in the context of legal proceedings'. The New Nuclear Forensics Vitaly Fedchenko, 2015 Nuclear material changes its form and properties as it moves through the nuclear fuel cycle from one facility to another Each step of the fuel cycle or each use of the material will inevitably leave its mark The science of determining the history of a sample of nuclear material through the study of these characteristics is known as nuclear forensics While nuclear forensic analysis has normally been associated with investigations and prosecutions in the context of trafficking of nuclear materials or nuclear terrorism it had wider applications in national security contexts such as nuclear non proliferation disarmament and arms control The New Nuclear Forensics is the first book to give a definitive guide to this broader definition of nuclear forensic analysis This book describes the various methods used in nuclear forensics giving first a broad introduction to the process followed by details of relevant measurement techniques and procedures In each case the advantages and limitations are outlined To put these methods in context the book also recounts the history of the discipline and describes the diverse contemporary applications of nuclear forensics

Nuclear Forensics Division on Earth and Life Studies, Nuclear and Radiation Studies Board, 2010-07-29 Nuclear forensics is important to our national security Actions including provision of appropriate funding are needed now to sustain and improve the nation's nuclear forensics capabilities The Department of Homeland Security DHS working with cooperating agencies and national laboratories should plan and implement a sustainable effective nuclear forensics program Nuclear forensics is the examination and evaluation of discovered or seized nuclear materials and devices or in cases of nuclear explosions or radiological dispersals of detonation signals and post detonation debris Nuclear forensic evidence helps law enforcement and intelligence agencies work toward preventing mitigating and attributing a nuclear or radiological incident This report requested by DHS the National Nuclear Security Administration and the Department of Defense makes

recommendations on how to sustain and improve U S nuclear forensics capabilities The United States has developed a nuclear forensics capability that has been demonstrated in real world incidents of interdicted materials and in exercises of actions required after a nuclear detonation The committee however has concerns about the program and finds that without strong leadership careful planning and additional funds these capabilities will decline **Subject Guide to Books in Print**

Nuclear Forensics ,2016 **Development of a National Nuclear Forensics Library** International Atomic Energy Agency,2019-02-04 This publication provides the rationale for the development of a national nuclear forensics library and addresses how a State may use such a national system in investigations of nuclear and other radioactive material out of regulatory control Nuclear forensics is the examination of nuclear or other radioactive material or of evidence that is contaminated with radionuclides in the context of legal proceedings under international or national law related to nuclear security The analysis of nuclear or other radioactive material seeks to identify what the materials are how when and where the materials were made and what their intended uses were Important when conducting a nuclear forensics examination is the ability of States to identify nuclear and other radioactive material within the State and determine whether those materials are consistent with domestic holdings As a system for the identification of nuclear or other radioactive material a national nuclear forensics library can facilitate interpretation of findings and assist States in this determination This publication seeks to assist States that choose to develop such a library tailored to their individual circumstances national legal requirements and security needs *Nuclear Forensics of Special Nuclear Material at Los Alamos* ,2010 Nuclear forensics of special nuclear materials is a highly specialized field because there are few analytical laboratories in the world that can safely handle nuclear materials perform high accuracy and precision analysis using validated analytical methods The goal of nuclear forensics is to establish an unambiguous link between illicitly trafficked nuclear material and its origin The Los Alamos National Laboratory Nuclear Materials Signatures Program has implemented a graded conduct of operations type approach for determining the unique nuclear chemical and physical signatures needed to identify the manufacturing process intended use and origin of interdicted nuclear material In our approach an analysis flow path was developed for determining key signatures necessary for attributing unknown materials to a source This analysis flow path included both

destructive i.e alpha spectrometry ICP MS ICP AES TIMS particle size distribution density and particle fractionation and non destructive i.e gamma ray spectrometry optical microscopy SEM XRD and x ray fluorescence characterization techniques Analytical techniques and results from three recent cases characterized by this analysis flow path along with an evaluation of the usefulness of this approach will be discussed in this paper

Over the past decade law enforcement governmental and public agencies have been stymied by the threat of the trafficking of nuclear materials During this time span reports from the International Atomic Energy Agency of illicit trafficking have increased eightfold from 20 to 160 For this reason nuclear forensics is a burgeoning science focused on the identification of seized special nuclear materials Identification of these materials is based upon the wealth of information that can be obtained by applying multiple analytical and measurement technologies All of the information gained from each sample can then be used to further characterize other samples culminating in the inclusion of all of the collected data into a central database Information must be reported in a timely manner as actionable results need to be presented as quickly as possible if there is to be any attribution for trafficking of nuclear material Identification parameters such as uranium content isotopic composition and levels of impurities can be measured simultaneously in an effort to completely characterize a sample All of these measurements combined can offer information as to the source of the material and its intended use Many of the current analytical techniques used in nuclear forensics require extensive sample preparation and offer minimal amounts of information about the sample Time of Flight Secondary Ion Mass Spectrometry TOF SIMS is presented as a rapid analytical technique that provides many of these identification parameters with minimal sample preparation TOF SIMS spectra were collected on eight different standard reference materials covering a range of stoichiometries and levels of enrichment Samples included UO₂ UO₃ and U₃O₈ stoichiometries ranging from slightly depleted 0.5% ²³⁵U to highly enriched 90.0% ²³⁵U uranium Spectra were simulated in an effort to deconvolve composite peaks resulting from the protonation of cluster ions This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work was reproduced from the original artifact and remains as true to the original work as possible Therefore you will see the original copyright references library stamps as most of these works have been housed in our most important libraries around the world and other notations in the work This work is in the public domain in the United States of America and possibly other nations Within the United States you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work As a reproduction of a historical artifact this work may contain missing or blurred pages poor pictures errant marks etc Scholars believe and we concur that this work is important enough to be preserved reproduced and made generally available to the public We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant
