Micronutrients in Health and Disease, Second Edition Kedar N. Prasad, 2019-04-15 Increased oxidative stress due to the production of excessive amounts of free radicals along with the effects of chronic inflammation plays a major role in the initiation and progression of most chronic diseases. In addition, increased release of glutamate plays a central role in the pathogenesis of various disorders. This second edition of *Micronutrients in Health and Disease* proposes a novel concept that in order to simultaneously and optimally reduce oxidative stress, chronic inflammation, and glutamate, it is essential to increase levels of antioxidant enzymes as well as levels of dietary and endogenous antioxidant compounds at the same time. This is accomplished by activating the Nrf2 pathways and by increasing the levels of antioxidant compounds and B vitamins through supplementation. This book proposes a mixture of micronutrients that achieves this above goal. The mixture of micronutrients together with modification in diet and lifestyle may reduce the risk of chronic diseases and in combination with standard care may improve the management of these diseases. **KEY FEATURES** Provides evidence in support of the idea that increased oxidative stress, chronic inflammation, and glutamate are involved in the pathogenesis of chronic diseases. Contains three new chapters on Huntington's disease, Autism spectra, and Prion disease. Discusses the role of microRNAs in the pathogenesis of chronic diseases. Presents information on regulation of the expression of microRNAs by reactive oxygen species and antioxidants. *Micronutrients in Health and Disease, Second Edition* serves as a valuable resource for those seeking to promote healthy aging and prevent and improved management of chronic diseases. **Personalized Nutrition**

in Chronic Kidney Disease, 2nd edition Lara Caldiroli, Alice Sabatino, Andreana De Mauri, 2024-11-08 Nutritional status is a crucial prognostic factor in chronic kidney disease (CKD) patients. The nutritional approach depends on the stage of renal disease, patients' comorbidities, protein catabolism, and the presence of malnutrition. The gradual and progressive worsening of kidney function, characterized by a reduced glomerular filtration rate, carries many challenges for both young and elderly patients. Dietetic nutritional therapy (DTN) has an important role in the prevention and in the progression of Chronic Kidney Disease. An appropriate nutritional approach contributes to the prevention and control of signs, symptoms, and metabolic complications of CKD, such as hyperkalemia, hyperphosphatemia, and metabolic acidosis. It also helps avoid malnutrition and protein energy wasting (PEW). Several dietary approaches have been proposed, but the most successful nutritional regimen is the one tailored on patients' needs. This Research Topic is open for original articles, narrative review, systematic review, and meta-analysis focusing on personalized nutrition in patients with CKD on both conservative and replacement treatments. Suggested topics relating to renal nutrition and chronic kidney disease may include but are not limited to: Use of amino acids or keto analogues; supplementation in CKD patients in conservative therapy or in dialysis; Strategies to improve dietary adherence; Psychological aspects of nutritional adherence; Nutritional indications in inflamed CKD patients; Interaction between diet, microbiota, and comorbidities; Personalized nutritional counseling; Strategies to avoid malnutrition and PEW.
