Method of Dimensionality

Reduction in Contact Mechanics Valentin L. Popov, Markus Hess, Emanuel Willert, 2018-08-08 The present book is a collection of open access papers describing the foundations and applications of the Method of Dimensionality Reduction MDR first published in the Journal Facta Universitatis Series Mechanical Engineering in the years 2014 2018 The Method of Dimensionality Reduction MDR is a method of calculation and simulation of contacts of elastic and viscoelastic bodies It consists essentially of two simple steps a substitution of the three dimensional continuum by a uniquely defined one dimensional linearly elastic or viscoelastic foundation Winkler foundation and b transformation of the three dimensional profile of the contacting bodies by means of the MDR transformation As soon as these two steps are done the contact problem can be considered to be solved For axial symmetric contacts only a small calculation by hand is required which does not exceed elementary calculus and will not be a barrier for any practically oriented engineer Alternatively the MDR can be implemented numerically which is almost trivial due to the independence of the foundation elements In spite of its simplicity all results are exact The present book brings together papers covering the most important aspects of the MDR and providing a practical guide for its use Handbook of Plane Contact Mechanics Valentin L. Popov, Markus Heß, Emanuel

Willert, 2025-02-18 The book contains a structured collection of complete solutions to all relevant plane contact problems

Classic profiles such as the cylinder the wedge or the rectangular flat punch are considered under centric and eccentric loading but also a variety of other technically relevant shapes such as the flat punch with rounded edges the wedge with rounded tip or wavy surfaces With regard to the load configuration adhesive and non adhesive normal contacts tangential contacts and rolling contacts are considered The materials considered are elastic isotropic transversally isotropic viscoelastic and functionally graded media The solutions given are derived in the simplest way available and in addition to the macroscopic relationships between load and contact configuration include the stress fields in the surface and where applicable within the contacting bodies **Contact Mechanics** J.R. Barber, 2018-02-09 This book describes the solution of

contact problems with an emphasis on idealized mainly linear elastic problems that can be treated with elementary analytical methods General physical and mathematical features of these solutions are highlighted Topics covered include the contact of

rough surfaces and problems involving adhesive e g van der Waals forces The author is a well known researcher in the subject with hands on experience of the topics covered and a reputation for lucid explanations The target readership for the book includes researchers who encounter contact problems but whose primary focus is not contact mechanics Coverage is also suitable for a graduate course in contact mechanics and end of chapter problems are included

computational methods crashworthiness impact and shock biomechanics experimental techniques computational methods versus experimental results and fracture fatigue and wear **Elasticity** Martin H. Sadd, 2025-06-05 Elasticity Theory Applications and Numerics Fifth Edition continues its market leading tradition of concisely presenting and developing the linear theory of elasticity moving from solution methodologies formulations and strategies into applications of contemporary interest such as fracture mechanics anisotropic and composite materials micromechanics nonhomogeneous graded materials and computational methods Developed for a one or two semester graduate elasticity course this new edition has been revised with new worked examples exercises and new or expanded coverage in recent areas of interest Using MATLAB software numerical activities in the text are integrated with analytical problem solutions and new symbolic software has now been introduced Includes a thorough yet concise introduction to linear elasticity theory and applications Presents detailed solutions to problems of nonhomogeneous graded materials Features a comparison of elasticity solutions with elementary theory experimental data and numerical simulations Provides hands on practice with additional MATLAB programming resources for students at <https://www.elsevier.com/books-and-journals/book-companion/9780443132452> Offers teaching support including a full solutions manual and lecture slides available for request by qualified instructors at <https://educate.elsevier.com/9780443132452> Mechanics of Fretting and Fretting Fatigue David A. Hills, Hendrik N. Andresen, 2021-04-25 This book which has only one very distant forerunner authored by David A Hills with David Nowell represents a very big step that is the quantification of these problems and represents the twenty five years worth of work which have gone on at Oxford since the first book on the subject Fatigue popularly metal fatigue is the primary failure mode of all machines engines transmissions and indeed almost all mechanical devices The propagation of cracks is well understood and is treated in the subject Fracture Mechanics By contrast the nucleation of cracks is very hard to quantify and this remains the case with so called free initiation and to a lesser extent at cracks nucleated from stress raising features But the third form of nucleation where cracks start from the edges of rubbing components that is at joints is potentially a very much better defined environment and therefore the problem is amenable to attack by applied mechanics and experiment The contents are of value both to those embarking on research on the subject and to practitioner in industry Contact Dynamics Nikolay Goloshchapov, 2019-02-08 This volume describes the application of the method of the differential specific forces MDSF By using this new method the solutions to the problems of a dissipative viscoelastic and elastic plastic contacts between curvilinear surfaces of two solid bodies can be found The novelty is that the forces of viscosity and the forces of elasticity can be found by an integration of the differential specific forces acting inside an elementary volume of the contact zone This volume shows that this method allows finding the viscoelastic forces for any theoretical or experimental dependencies between the distance of mutual approach of two curvilinear surfaces and the radiuses of the contact area Also the derivation of the integral equations of the viscoelastic forces has been given and the equations for the contact pressure have been

obtained The viscoelastic and elastic plastic contacts at impact between two spherical bodies have been examined The equations for work and energy in the phases of compression and restitution and at the rolling shear have been obtained Approximate solutions for the differential equations of movement displacement by using the method of equivalent work have been calculated This new method of differential specific viscoelastic forces allows us to find the equations for all viscoelastic forces It is principally different from other methods that use Hertz's theory the classical theory of elasticity and the tensor algebra This method will be useful in research of contact dynamics of any shape of contacting surfaces It also can be used for determination of the dynamic mechanical properties of materials and in the design of wear resistant elements and coverings for components of machines and equipment that are in harsh conditions where they are subjected to the action of flow or jet abrasive particles This volume will be useful for professional designers of machines and mechanisms as well as for the design and development of new advanced materials such as wear resistant elastic coatings and elements for pneumatic and hydraulic systems stop valves fans centrifugal pumps injectors valves gate valves and in other installations

Computational Methods and Experimental Measurements XIII C. A. Brebbia, G. M. Carlomagno, 2007 Containing papers presented at the Thirteenth International Conference in this well established series on CMEM Computational Methods and Experimental Measurements These proceedings review state of the art developments on the interaction between numerical methods and experimental measurements Featured topics include Computational and Experimental Methods Experimental and Computational Analysis Computer Interaction and Control of Experiments Direct Indirect and In Situ Measurements Particle Methods Structural and Stress Analysis Structural Dynamics Dynamics and Vibrations Electrical and Electromagnetic Applications Biomedical Applications Heat Transfer Thermal Processes Fluid Flow Data Acquisition Remediation and Processing and Industrial Applications Nonsmooth Dynamics of Contacting Thermoelastic Bodies Jan Awrejcewicz, Yuriy Pyr'yev, 2008-12-10 In this work methods of analysis and models of contacting systems dynamics including heat generation and wear exhibited by such systems are presented It should be emphasised that the methods and mathematical models of contacting systems exhibited by rigid elastic bodies and heat wear processes have been so far applied separately Tribological processes occurring on a contact surface were not taken into consideration in the analysis of the dynamic rigid or elastic body models On the other hand most of the introduced models of bodies in contact that took tribological effects into consideration did not allow for their inertia analysis This study contributes to the development of this field as the models presented here yield prediction of the behaviour of contacting systems taking into account both mentioned aspects simultaneously When considered from the mathematical point of view the method of analysis is reduced to the solution of the system of differential equations describing the velocities of contacting bodies and Volterra integral equation modelling contact pressure The latter equation is obtained with the use of the Laplace integral transform
