1. This chemical energy is stored in the pyrophosphate bond, which is located between ATP's final two phosphate groups. When the cells require energy to perform any function, ATP cleaves the third phosphate group, releasing a significant amount of energy stored in the bond between the third and second phosphate groups. ATP can release and store energy by breaking and re-forming the bonds between its phosphate groups. Additionally, when a cell has energy available, it can store small amounts of it by adding phosphate groups to ADP to produce ATP.
2. The energy from the sun is captured by plants through photosynthesis. The energy is then used to produce glucose, which is used by the plant for energy. The energy is also used to produce ATP, which is used by the plant for energy.
3. The energy from the sun is captured by plants through photosynthesis. The energy is then used to produce glucose, which is used by the plant for energy. The energy is also used to produce ATP, which is used by the plant for energy.
