highly affected by the beam alignment duration and transmission strategy directional or broadcast The second part of this dissertation focuses on problems related to mm wave communications in industrial scenarios where robots and new industrial applications require high data rates and stringent reliability and latency requirements In the fourth paper we consider a multi AP mm wave wireless network covering an industrial plant where multiple moving robots need to be connected We show how the joint optimization of robots paths and the robot AP associations can increase mm wave robustness by decreasing the number of handovers and avoiding coverage holes Finally the fifth paper considers scenarios where robot AP communications are assisted by an intelligent reflective surface IRS We show that the joint optimization of beamforming and trajectory of the robot can minimize the motion energy consumption while satisfying time and communication QoS constraints Moreover the proposed solution exploits a radio map to prevent collisions with obstacles and to increase mm wave communication robustness by avoiding poorly covered areas
