

within the ranges shown in Figure 3B, ie, 795 mL/d during months 1 to 4 in The Gambia and 670 mL/d in Papua New Guinea during the same postpartum interval. Mean values currently in the literature obtained by test weighing the mother were not corrected for insensible weight loss and were elevated (42); although the technique can be used with accuracy (43), correction for insensible weight loss is essential (9).

The mean intraindividual CV in all the studies shown in Figure 5, weighted for subject number, was 17% compared with a value of 14% in our study. The consistency among the milk-volume data derived from 16 studies from nine countries suggests that there is now sufficient data in the literature on exclusively breast-feeding women during the first 8 mo postpartum so that reference data can be established for the temporal dependence of human-milk-volume transfer. Further, analysis of our longitudinal data suggests that the increase in milk transfer from months 2 to 5 ( $\sim 1$  g/d) reflects a general pattern observed in most individuals. During the first month of lactation, the individual temporal patterns tend to deviate rather widely from the population pattern and must be studied on an individual basis.

#### *Sources of variability among individuals*

We conclude from our longitudinal data that there is a characteristic milk-volume transfer for each mother-infant pair after the first month of lactation. The volume transferred was not related to yields or intakes at the onset of lactation, suggesting that maternal variables associated with lactogenesis do not regulate milk production during full lactation. This conclusion is strengthened by the observation that mean yield in mothers who overproduced during early lactation (eg, those who removed significant volumes by breast pump or manual expression) was not different from mean yield in nonoverproducers at any time during lactation (data not shown). Volume transfer after the first month was significantly related to infant weight ( $p < 0.02$ ). Because the correlation between milk transfer and infant weight was stronger at the end of each time interval examined than at the beginning (Fig 6B), we suggest that some factor or factors other than infant weight per se are the primary determinants of transfer from mother to infant. Future studies might well focus on the relation between milk output in early lactation and such factors as milk composition, the infant's growth potential as expressed in parental and grandparental size, the strength of the infant's suck, and infant basal metabolic rate.

#### *Conclusion*

The major objective of this study was to provide longitudinal data on milk-volume production and infant intake in a small, relatively homogeneous group of exclusively breast-feeding women. Such data are necessary to provide a temporal basis for the design of cross-sectional studies with a large enough number of subjects to allow reliable statistical analysis of maternal and infant vari-

ables influencing milk production. It is gratifying, therefore, that our data differ in no significant respect from milk-volume data obtained in larger, cross-sectional studies from a variety of populations throughout the world. Mean milk transfer is low during the first 2 d postpartum, rises rapidly on days 3 and 4, and then increases more slowly to reach maximum levels of  $\sim 800$  mL/d at 6 mo postpartum in exclusively breast-feeding women. The pattern of milk transfer for a given mother-infant pair appears to be largely set by the end of the first month. The interindividual CV is  $\sim 16\%$  in most studies; this variation is related most closely to infant size and may be more a function of infant demand than any maternal variable (2, 3, 32). Future studies focusing on infant factors that influence the demand for breast milk in the first month postpartum may be of considerable importance in understanding the growth of the breast-fed infant. **□**

We acknowledge the helpful discussions of Mary Frances Picciano and an unknown referee in the interpretation of these studies. Most important, however, was the unstinting enthusiasm and cooperation of the mothers who served as subjects through a tedious year of test weighing, milk samples, and diet records. Without the dedication of these subjects to furthering our knowledge of the physiology and nutritional significance of lactation, these studies could not have been done.
