Wagner,2012-11-12 When most people think of space they think of physical space However visual space concerns space as consciously experienced and it is studied through subjective measures such as asking people to use numbers to estimate perceived distances areas angles or volumes This book explores the mismatch between perception and physical reality and describes the many factors that influence the perception of space including the meaning assigned to geometric concepts like distance the judgment methods used to report the experience the presence or absence of cues to depth and the orientation of a stimulus with respect to point of view The main theme of the text is that no single geometry describes visual space but that the geometry of visual space depends upon the stimulus conditions and mental shifts in the subjective meaning of size and distance In addition The Geometries of Visual Space contains philosophical mathematical and psychophysical background

material looks at synthetic approaches to space perception including work on hyperbolic spherical and Euclidean geometries presents a meta analysis of studies that ask observers to directly estimate size distance area angle and volume looks at the size constancy literature in which observers are asked to adjust a comparison stimulus to match a variety of standards at different distances away discusses research that takes a multi dimensional approach toward studying visual space and discusses how spatial experience is influenced by memory While this book is primarily intended for scholars in perception mathematical psychology and psychophysics it will also be accessible to a wider audience since it is written at a readable level It will make a good graduate level textbook on space perception

Thomas Wolbers, Paul A Dudchenko, Emma R Wood, 2015-01-09 The global population aged over 60 is set to rise dramatically in the coming decades In many countries the older population now faces the prospect of spending a quarter of their lives aged over 65 and a significant proportion will have to cope with cognitive decline associated with normal ageing or with dementia disorders Given that these fundamental demographic changes will pose a significant challenge to health care systems a detailed understanding of age related cognitive and neurobiological changes is essential in helping elderly populations maintain cognitive performance In addition developing sensitive biomarkers to identify those at risk of developing dementia is crucial for early and effective interventions To make inferences about the ageing process from the animal model back to the human rigorous behavioral paradigms must be used to ensure that the same function is being examined across species Given that similar navigational paradigms can easily be applied to humans and animals recent years have seen an expansion of studies attempting to bridge the gap between age related changes in animal and human spatial cognition These studies begin to suggest that disruptions in spatial computations are among the earliest indicators of impending cognitive decline In addition although many animal studies have identified pathological mechanisms with paradigms involving spatial navigation these mechanisms support many nonspatial cognitive functions as well As a consequence a successful characterization of how spatial processing changes in the ageing brain could reveal fundamental effects of cognitive ageing that could inform about general mechanisms underlying decline in perception mnemonic processing and multisensory integration
