Barnes,2006-06-06 The scientific and social history surrounding the 1880 incident of a foul odor in Paris and the development of public health culture that followed Late in the summer of 1880 a wave of odors enveloped large portions of Paris As the stench lingered outraged residents feared that the foul air would breed an epidemic Fifteen years later when the City of Light was in the grips of another Great Stink the public conversation about health and disease had changed dramatically Parisians held their noses and protested but this time few feared that the odors would spread disease Historian David S Barnes examines the birth of a new microbe centered science of public health during the 1880s and 1890s when the germ theory of disease burst into public consciousness Tracing a series of developments in French science medicine politics and culture Barnes reveals how the science and practice of public health changed during the heyday of the Bacteriological Revolution Despite its many innovations however the new science of germs did not entirely sweep away the older sanitarian view of public health The longstanding conviction that disease could be traced to filthy people places and substances remained strong even as it was translated into the language of bacteriology Ultimately the attitudes of physicians and the French public were shaped by political struggles between republicans and the clergy by aggressive efforts to educate and civilize the peasantry and by long term shifts in the public s ability to tolerate the odor of bodily substances A well developed study in medically related social history it tells an intriguing tale and prompts us to ask how our own cultural contexts affect our views and actions regarding environmental and infectious scourges here and now New England Journal of Medicine Both

*Anthropogenic Impacts on the Microbial Ecology and Function of Aquatic Environments* Maurizio Labbate, Justin R. Seymour, Federico Lauro, Mark V. Brown, 2016-09-06 Aquatic ecosystems are currently experiencing unprecedented levels of impact from human activities including over exploitation of resources habitat destruction pollution and the influence of climate change The impacts of these activities on the microbial ecology of aquatic environments are only now beginning to be defined One of the many implications of environmental degradation and climate change is the geographical expansion of disease causing microbes such as those from the *Vibrio* genus Elevating sea surface temperatures correlate with increasing *Vibrio* numbers and disease in marine animals e g corals and humans Contamination of aquatic environments with heavy metals and other pollutants affects microbial ecology with downstream effects on biogeochemical cycles and nutrient turnover Also of importance is the pollution of aquatic environments with antibiotics resistance genes and the mobile genetic elements that house resistance genes from human and animal waste Such contaminated environments act as a source of resistance genes long after an antibiotic has ceased being used in the community Environments contaminated with mobile genetic elements that are adapted to human commensals and pathogens function to capture new resistance genes for potential reintroduction back into clinical environments This research topic encompasses these diverse topics and describes the affect s of human activity on the microbial ecology and function in aquatic environments and describes methods of restoration and for modelling disturbances
