**Methodologies and Techniques for Advanced Maintenance** Lorenzo Fedele, 2011-01-06. The management of technical plants for productivity and safety is generally a complex activity, particularly when many plants in one territory are affected. Quality guarantees and cost results are required, and the technology involved is heterogeneous and innovative. To enable readers to manage technical plants efficiently despite the above complications, *Methodologies and Techniques for Advanced Maintenance* presents theories, methodologies, and practical tools for the realization of an intelligent maintenance management system for distant monitoring. It also covers the development and running of a remote control center. The so-called granted availability management system GrAMS was conceived to enable organizations involved in technical industrial plant management to move towards well-known availability and zero failures management. In particular, *Methodologies and Techniques for Advanced Maintenance* deals with the diagnostic aspects and safety levels of technical plants such as elevators, thermo-technical plants, etc. The author also discusses the usage of ad hoc designed software analysis tools based on neural networks and reliability indicators. *Methodologies and Techniques for Advanced Maintenance* is a useful text for practitioners and researchers in maintenance and facilities. Its application spans industrial plant technological infrastructure and civil fields.
