Quantitative Models for Value-Based Supply Chain Management Marcus Brandenburg, 2012-10-24 Supply chain management SCM strives for creating competitive advantage and value for customers by integrating business processes from end users through original suppliers However the question of how SCM influences the value of a firm is not fully answered Various conceptual frameworks that explain the coherence of SCM and company value comprehended as value based SCM are well accepted in scientific research but quantitative approaches to value based SCM are found rather seldom The book contributes to this research gap by proposing quantitative models that allow for assessing influences of SCM on the value of a firm Opposed to existing models that limit the observation to chosen facets of SCM or selected value drivers this holistic approach is adequate to reflect

configurational and operational aspects of SCM cover all phases of the product life cycle financially compare value impacts of profitability related and asset related value drivers and assess influences of dynamics and uncertainties on company value

In times of declining economic growth companies have to control their costs more than ever to save resources needed in the future. Regardless of the economic size of the company the processes of production and logistics play a decisive role in stabilizing procedures and avoiding waste. Both are important cost drivers in manufacturing companies and therefore they offer large potential savings. Pervasive networking in the last years has contributed to a hitherto unknown transparency of global markets. This harmonization opened up new possibilities of entering foreign markets for procurement and sales to the companies. The emerging global procurement strategy was understood as a chance to rethink the relocation of existing production facilities to profit from existing differences in price and performance as a resource saving factor. Many companies tended towards a reduction of their vertical integration by outsourcing sections of their value chain. These contracted services of production result in higher transport volumes, increased complexity of supply processes and new requirements on logistic networks. This trend of outsourcing has not stopped but is slowing down noticeably. Additionally, there is an increasing proportion of companies restoring business units that were outsourced before. Reasons for turning back decisions are often to be found in missed goals. It is not unusual that important cost factors were disregarded in the original basis of decision making. In the meantime many companies have realized that it is easier to achieve stability of processes and therewith a control of costs by increasing their own contribution to production. Especially in times of under utilized capacities like in the current crisis insourcing can be a strategic option. Supply Chain Integration in the Building Industry Ruben Vrijhoef, 2011. Originally presented as the author's doctoral dissertation at Technische Universiteit Delft on November 25, 2011.
