Sarcone, Marie-Jo Waeber, 2017 The brain is an amazing thing but it doesn't always get things right when it comes to sight This book is here to explain why with astounding images baffling puzzles and simple reveals which show the reader how each trick works Templates included at the back of the book reveal answers and aid the creation of astounding illusions The science behind each element will be simply explained in an engaging way to encourage the reader to find out more each time Throughout the book will be chances for the reader to get hands on with the illusions with step by step experiments or tips on how to draw your own moving optic art on paper or on the computer *Brain-powered Science* Thomas O'Brien, 2010 How can a long metal needle pass through a balloon without popping it How can water flow at very different rates through two identical funnels How can a stick placed on a table under several sheets of newspaper and extended over the edge of a table snap when quickly struck without lifting or tearing the paper Author Thomas O'Brien takes these and 30 more science inquiry activities to a higher level in this book for educators who love to surprise and challenge their students with unanticipated results Using experiments based on the science of a discrepant event an experiment or demonstration in which the outcome is not what students expect O'Brien shows how learners can be motivated to reconsider their preconceived notions and think more closely about what has actually occurred and the underlying scientific explanations What makes this volume more

valuable than a mere activity book is the addition of a science education component to the extensive science content found in each activity Each discrepant event is shown to be analogous to a pedagogical principle Speaking directly to teachers O'Brien writes Your participation as teacher as learner experimenter rather than simply passive reader in these minds on activities will lead you to question and help you to revise your implicit assumptions about the nature of science teaching and learning At the same time you will develop expertise with activities that you can use with your own students The dual purpose activities thus allow you to unlock two doors with one key the doors to your own learning and to your students learning The detailed analogies between the activities and science learning make the book an ideal resource for middle and high school teachers science teacher educators and their preservice students and professional development specialists alike This thorough and thought provoking text includes more than 200 up to date internet resources as well as extensions to each of the physical science biology and chemistry activities bringing the total number of inquiry activities to nearly 120 Most important the author reminds teachers that the study of science is full of surprises and should be both meaningful and fun for students Optical Illusions Al Seckel,2002 Light Science Thomas Rossing,Christopher J Chiaverina,1999-09-24

Intended for students in the visual arts and for others with an interest in art but with no prior knowledge of physics this book presents the science behind what and how we see The approach emphasises phenomena rather than mathematical theories and the joy of discovery rather than the drudgery of derivations The text includes numerous problems and suggestions for simple experiments and also considers such questions as why the sky is blue how mirrors and prisms affect the colour of light how compact disks work and what visual illusions can tell us about the nature of perception It goes on to discuss such topics as the optics of the eye and camera the different sources of light photography and holography colour in printing and painting as well as computer imaging and processing **Cognitive Science in Education and Alternative Teaching Strategies**

Cox, Andrea Benucci, R. Clay Reid, 2015-11-18 Vision is the process of extracting behaviorally relevant information from patterns of light that fall on retina as the eyes sample the outside world Traditionally nonhuman primates macaque monkeys in particular have been viewed by many as the animal model of choice for investigating the neuronal substrates of visual processing not only because their visual systems closely mirror our own but also because it is often assumed that simpler brains lack advanced visual processing machinery However this narrow view of visual neuroscience ignores the fact that vision is widely distributed throughout the animal kingdom enabling a wide repertoire of complex behaviors in species from insects to birds fish and mammals Recent years have seen a resurgence of interest in alternative animal models for vision research especially rodents This resurgence is partly due to the availability of increasingly powerful experimental approaches e g optogenetics and two photon imaging that are challenging to apply to their full potential in primates Meanwhile even more phylogenetically distant species such as birds fish and insects have long been workhorse animal models for gaining insight

into the core computations underlying visual processing. In many cases these animal models are valuable precisely because their visual systems are simpler than the primate visual system. Simpler systems are often easier to understand and studying a diversity of neuronal systems that achieve similar functions can focus attention on those computational principles that are universal and essential. This Research Topic provides a survey of the state of the art in the use of animal models of visual functions that are alternative to macaques. It includes original research methods articles, reviews, and opinions that exploit a variety of animal models including rodents, birds, fishes, and insects, as well as small New World monkey, the marmoset, to investigate visual function. The experimental approaches covered by these studies range from psychophysics and electrophysiology to histology and genetics, testifying to the richness and depth of visual neuroscience in non-macaque species.
