16. Hydraulic filter

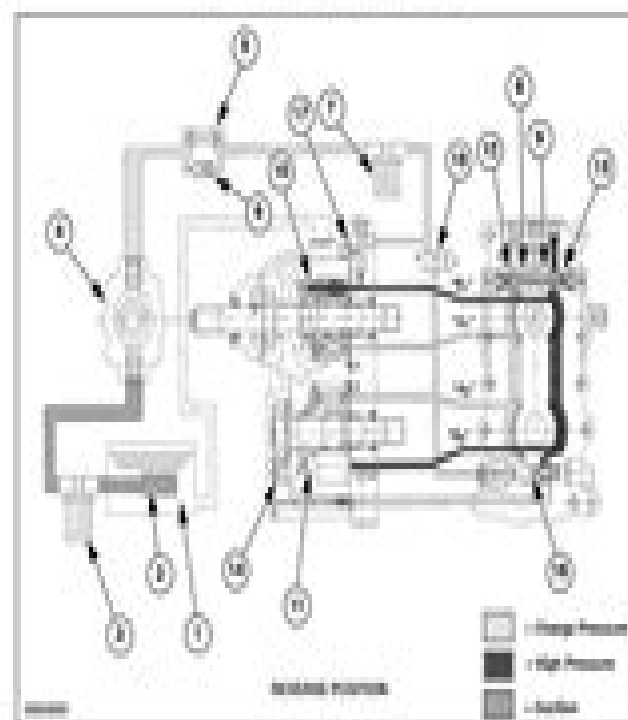

Oil, Fluid - FORWARD POSITION

When the hydraulic pump/pump, 1, is running and the reservoir level is depressed, moving the pump can cause fluid leakage, oil flow from the pump pump, through passage 11. Pump pressure in the back of the check valve 10 causes the pump valve and pressure increases in passage 11. Oil flow from passage 11 flows to the hydraulic motor, 13, through passage 12, causing the motor to rotate and move the actuator. When the reservoir level is depressed further the increased oil flow causes the motor faster increasing wheel speed. Fluid in

passage 11 flows back to the hydraulic pump, 1, through passage 10 to complete the cycle. When fluid leakage in the system causes a drop in pressure in the relief passage 11, below 5.4 - 6.1 bar (80 - 90 PSI) the check valve, 10, opens and pressure rises up fluid from the charge pump to replace the oil in the pressure side of the line. Ensure that the charge pump is returned to the pump via the charge pump relief valve, 11.

The high pressure relief valve, 10, protects the motor, 13, opening when pressure is above 5.4 bar (80 PSI).
