

Chapter 3: Cell Structure and Function Test Bank

MULTIPLE CHOICE

1. Glycolysis is the metabolic process of breaking down a glucose molecule to form
 - a. CO_2 and H_2O .
 - b. 2 ATP and 2 pyruvate.
 - c. 30 ATP.
 - d. oxygen.

ANS: B

Glycolysis produces a net gain of 2 ATP molecules and breaks down glucose modules to produce two pyruvate molecules. Oxidative phosphorylation produces CO_2 and H_2O . Oxidative phosphorylation produces 30 ATP molecules. Oxygen is not produced by glycolysis, but it is necessary for oxidative phosphorylation.

REF: Pg. 34

2. The benefit of glycolysis is that this phase supplies
 - a. ATP to meet energy needs of the body.
 - b. pyruvate to the citric acid cycle.
 - c. energy for oxidative phosphorylation.
 - d. lactate during anaerobic conditions.

ANS: B

The benefit of glycolysis is to supply pyruvate to the citric acid cycle of cellular metabolism, which then produces much ATP. Glycolysis only produces 2 ATP modules, which is insufficient for energy needs. Glycolysis does not supply energy for oxidative phosphorylation. Lactate produced during prolonged anaerobic conditions builds up and can lead to lactic acidosis, which is an undesirable outcome.

REF: Pg. 34

3. Repolarization of a neuron after a depolarizing action potential is due to
 - a. activation of the Na^+/K^+ pump.
 - b. influx of calcium.
 - c. efflux of potassium.
 - d. influx of sodium.

ANS: C

Repolarization is due to efflux of potassium from the cell. The Na^+/K^+ pump maintains cellular volume via osmotic pressure and helps to maintain resting membrane potential. Calcium influx prolongs the action potential. Influx of sodium initiates depolarization.

REF: Pg. 45

4. Excitable cells are able to conduct action potentials because they have
 - a. receptors for neurotransmitters.
 - b. tight junctions.

Pathophysiology Test Questions From Copstead
