1.5 General Engine Information

1.5.1 The Four-Cycle Principle for Diesel Engines

The diesel engine is an internal combustion engine, in which the energy of burning fuel is converted into energy to work each cylinder of the engine. In the diesel engine, air alone is compressed in the cylinder, raising its temperature significantly. After the air has been compressed, a charge of fuel is sprayed into the cylinder and ignition is accomplished by the heat of compression. The four piston strokes of the cycle occur in the following order: intake (1), compression (2), power (3) and exhaust (4).

1.5.2 Intake Stroke

During the intake stroke, the piston travels downward, the intake valves are open, and the exhaust valves are closed. The down stroke of the piston facilitates air from the intake manifold to enter the cylinder through the open intake valves. The turbocharger assures a full charge of air is available for the cylinder by increasing the air pressure in the engine intake manifold. The intake charge consists of air only with no fuel mixture.

1.5.3 Compression Stroke

At the end of the intake stroke, the intake valves close and the piston starts upward on the compression stroke. The exhaust valves remain closed. At the end of the compression stroke, the air in the combustion chamber has been compressed by the piston to occupy a space about one-seventeenth as great in volume as it occupied at the beginning of the stroke. Thus, the compression ratio is 17.6:1. Compressing the air into a small space raises the temperature of that air to red. During the last part of the compression stroke and the early part of the power stroke, a small metered charge of fuel is injected into the combustion chamber. Almost immediately after the fuel charge is injected into the combustion chamber, the fuel is ignited by the hot air and starts to burn, beginning the power stroke.
