Empire of the Sum Keith Houston, 2023-08-22 A New York Times Book Review Editors Choice. A lively entertaining history. New York Times Book Review Editors Choice. The hidden history of the pocket calculator, a device that ushered in modern mathematics, helped build the atomic bomb and went with us to the moon and the mathematicians, designers and inventors who brought it to life. Starting with hands, abacus and slide rule, humans have always reached for tools to simplify math. Pocket sized calculators ushered in modern mathematics, helped build the atomic bomb, took us to the bottom of the ocean and accompanied us to the moon. The pocket calculator changed our world until it was supplanted by more modern devices that in a cruel twist of irony it helped to create. The calculator is dead, long live the calculator. In this witty mathematic and social history, Keith Houston transports readers from the nascent economies of the ancient world to World War II where a Jewish engineer calculated for his life at Buchenwald and into the technological arms race that led to the first affordable electronic pocket calculators. At every turn, Houston is a scholarly affable guide to this global history of invention. Empire of the Sum will appeal to math lovers, history buffs and anyone seeking to understand our trajectory to the computer age.

The Frankencamera Eino-Ville Aleksi Talvala, 2011 Digital cameras, both in traditional form factors and as parts of cell phones, have become ubiquitous over the last decade. But for the most part, they remain black boxes to the end user and cannot be reprogrammed or modified. This has become an obstacle to researchers in the new field of computational photography who want to use the growing computing power of digital cameras to create images no traditional camera could produce. This dissertation presents the Frankencamera platform, a digital camera system designed for computational photography. The Frankencamera is a fully open, fully programmable digital camera which can be easily modified to test out new research ideas. The Frankencamera architecture allows for per frame control of the capture process and accurate synchronization of all the components that make up the camera. Based on this

architecture this dissertation details two hardware platforms the F2 a flexible custom built camera and the Nokia N900 a commercial smartphone Both platforms can be easily programmed at a high level using the FCam API written to embody the Frankencamera architecture Finally this dissertation presents several sample applications for the Frankencamera platform Several of these applications could not have been developed for any existing camera platform and the ease and speed at which they were written show that the Frankencamera platform is a compelling tool for computational photography
