Brodetsky, William P. Milne, 2013-12

An excerpt from the beginning of the INTRODUCTION 1 Object of Nomography We are all familiar with graph drawing as a means of solving equations But ordinary graphical methods are often inconvenient because a separate graph is required for practically each equation we have to solve Thus to solve the quadratic equation  $x^2 + 2x + 0 = 0$  we need to draw the graph  $y = x^2 + 2x$  and find where it is cut by the line  $y = 0$  To solve the equation  $x^2 + 2x + 2 = 0$  we must draw the graph  $y = x^2 + 2x$  and similarly for other values of the coefficient of  $x$  The object of Nomography is to enable us to solve all equations of a given type by means of one diagram Thus all quadratic equations of the type  $x^2 + ax + b = 0$  can be solved by means of one graph which can be drawn once for all In the same way all cubic equations of say the form  $x^3 + ax + b = 0$  can be solved graphically by means of one diagram Such a diagram is called a Nomogram It is also the object of Nomography to enable us to find the value of a complicated expression graphically Let us consider e.g. the formula for the pressure  $R$  in pounds on a flat plate normal to a passing current of air viz  $R = 0.0194WSV^2$  lbs where  $W$  is the weight of the air in pounds per cubic foot  $S$  is the area of the plate in square feet and  $V$  is the relative velocity of the air in feet per second If the pressure has to be found for a number of different plates at various velocities it is obviously convenient to have a diagram which having been constructed once for all can be used for any values of  $W$ ,  $S$  and  $V$  that are likely to occur In the present volume we shall consider in a simple manner how to construct and use nomograms for multiplication and division in formulae like the one for air pressure as well as the more general methods applicable to easy algebraic and other equations As an introduction to the nomograms for multiplication and division we shall consider first the construction and use of nomograms for addition and subtraction

Nomography deals with geometrical transformations particularly projective transformations of a plane The book reviews projective plane and collineation transformations in geometrical and algebraical terms The geometrical approach aims at permitting the use of elementary geometrical methods in drawing collineation nomograms consisting of three rectilinear scales The algebraical treatment concerns nomograms containing curvilinear scales The text explains functional scales that include the graph of a function and a logarithmic scale The book explores equations which can be represented by elementary methods without the use of a system of coordinates some equations that require algebraic calculations as well as nomograms with a binary field lattice nomograms The text investigates collineation monograms of many variables elementary geometrical methods of joining nomograms and also of nomograms consisting of two parts to be superimposed on each other

In addition to the Massau method and the criterion of Saint Robert the book also applies the criteria of nomogrammability of a function to address mathematical problems related to the analysis of the methods in constructing nomograms The book can be useful for mathematicians geometricians engineers and researchers working in the physical sciences who use graphical calculations in their work **Best Approximation by Linear Superpositions (approximate Nomography)** S. ĪA.

Khavinson,1997-01-01 This book deals with problems of approximation of continuous or bounded functions of several variables by linear superposition of functions that are from the same class and have fewer variables The main topic is the space of linear superpositions  $D$  considered as a sub space of the space of continuous functions  $C(X)$  on a compact space  $X$  Such properties as density of  $D$  in  $C(X)$  its closedness proximality etc are studied in great detail The approach to these and other problems based on duality and the Hahn Banach theorem is emphasized Also considerable attention is given to the discussion of the Diliberto Straus algorithm for finding the best approximation of a given function by linear superpositions

The book presents the history of ICMI through a prosopographical approach In other words it pays a lot of attention to the actors of the International movement The portraits of the members of the ICMI Central Committees 1908 1936 and ICMI Executive Committees 1952 2008 and other eminent figures in ICMI history who have passed away in the first 100 years of its life are the guiding thread of the volume Each portrait includes Biographical information An outline of the various contributions made by the individual in question to the study of problems pertaining to mathematics teaching education Primary bibliography Secondary with particular attention to the publications concerning the teaching of mathematics Images photos book frontispieces relevant manuscripts The authors of the portraits 30 altogether are researchers in the history of mathematics mathematics and mathematics education The focus on the officer's role within ICMI and on his/her contributions to mathematics education make the portraits different from usual biographies In particular since most officers were active mathematicians the portraits shed light on aspects of their lesser known activity Connecting chapters place the action of these figures in the historical context and in the different phases of ICMI history Disasterman C.
