

Chiral superconductivity in non centrosymmetric materials

- Chiral superconductivity in non-centrosymmetric materials displays unconventional pairing due to the lack of a center of symmetry
- This asymmetry leads to mixed singlet and triplet pairing states, influencing the material's electronic properties
- Key features include potential topological superconductivity and unique responses to magnetic fields
- Such materials are promising for quantum computing applications due to their exotic electronic states

Practical example: Quantum computing

- Chiral superconductivity in non-centrosymmetric materials offers a promising avenue for quantum computing
- In these materials, the lack of a center of symmetry allows for unique electron pairing, crucial for superconductivity
- This property is essential in quantum computing for creating stable qubits— the building blocks of quantum information processing
- The manipulation of these electron pairs could potentially lead to more robust and scalable quantum computers that operate efficiently at higher temperatures
