## Nutrient Requirement Tables

Requirements for rumen degradable protein (RDP), rumen undegradable protein (RUP), and total protein are dependent on animal factors, the concentration of available energy in the diet, and dry matter intake. The dietary requirement for minerals depends on animal factors and the bioavailability of the minerals which differs among feedstuffs and diets. Tables of nutrient requirements are included to provide users with general guidelines and to illustrate how dietary factors influence requirements of some nutrients. The computer model uses animal and dietary factors to estimate requirements and will produce the most accurate estimates of requirements for specific situations and specific diet formulations. Users are strongly encouraged to use model-generated requirements.

### LACTATING COWS

Tables 14-1 through 14-6 show RDP, RUP, and total crude protein (CP) requirements for small and large breed lactating cows at different production levels as generated by the computer model. These tables also illustrate the effect of dietary energy concentration (Tables 14-2 vs. 14-3 and 14-5 vs. 14-6) and the effect of intake (Tables 14-1 vs. 14-2 and 14-4 vs. 14-5) on protein requirements. Tables 14-7 through 14-9 provide estimates of nutrient requirements of lactating (early and mid) and dry cows. These tables were also generated using the computer model, but the subcommittee has included its recommendations for certain nutrients that require special consideration, when using the model. Dietary requirements for minerals shown in Tables 14-7 through 14-9 are applicable only to the diets included in the tables. Different diets, because of differences in bioavailability of minerals may yield different dietary requirements for minerals.

The values in the tables are the subcommittee's best estimates of requirements when cattle are fed specific dietary formulations under nonstressful environmental

conditions. These tables (Tables 14-1 through 14-16) are intended as guides, and readers are encouraged to pay careful attention to footnotes in the tables. The computer model allows great flexibility in accounting for many dietary, environmental, and management factors that affect animal performance in contrast to the static numbers presented in tables.

### HEIFERS

The equations outlined in Chapter 16 were used to develop tables containing guidelines for the nutrient requirements of dairy replacement heifers (Tables 14-12 through 14-16). At a predicted DMI, the TDN concentration needed to meet the requirements for maintenance and gain were determined. The requirements obtained with the computer program may differ slightly from those in Tables 14-12 through 14-15 because the model-predicted supply of nutrients affects the calculation of some dietary requirements. These differences are due to variation in RUP intestinal digestibility, predicted diet TDN, and mineral bioavailabilities as described below. These tables are guidelines only and the NBC computer program should be used to evaluate the nutritional adequacy of specific diets. These requirement tables were calculated to approximate the requirements obtained with the computer program when heifers are fed a typical diet at the model-predicted dry matter intake, using the following assumptions.

1. The TDN used is the TDN discounted to account for depression in digestibility at intakes above maintenance.
2. DE (Mcal) was assumed to equal  $4.409 \times \text{TDN (kg)}$ . In the model, this value varies slightly among diets.
3. An RUP intestinal digestibility of 67 percent was assumed. This value ranges from 60 percent for diets based entirely on very mature forages fed to heifers with low requirements to approximately 75 percent for diets typi-
