

MIS CASE STUDY

a. In the light of the system, describe the decisions to be made in the area of strategic planning, managerial control and operational control? What information would you require to make such decisions?

Ans:- 1. A management information system (MIS) is an organized combination of people, hardware, communication networks and data sources that collects, transforms and distributes information in an organization. An MIS helps decision making by providing timely, relevant and accurate information to managers. The physical components of an MIS include hardware, software, database, personnel and procedures.

Management information is an important input for efficient performance of various managerial functions at different organization levels. The information system facilitates decision making. Management functions include planning, controlling and decision making. Decision making is the core of management and aims at selecting the best alternative to achieve an objective. The decisions may be strategic, tactical or technical. Strategic decisions are characterized by uncertainty. They are future oriented and relate directly to planning activity. Tactical decisions cover both planning and controlling. Technical decisions pertain to implementation of specific tasks through appropriate technology. Sales region analysis, cost analysis, annual budgeting, and relocation analysis are examples of decision-support systems and management information systems.

There are 3 areas in the organization. They are strategic, managerial and operational control.

Strategic decisions are characterized by uncertainty. The decisions to be made in the area of strategic planning are future oriented and relate directly to planning activity. Here basically planning for future that is budgets, target markets, policies, objectives etc. is done. This is basically a top level where up-to-the minute information on the food items ordered and breaks

Management Information Systems for Microfinance Arvind Ashta, 2015-10-19 Microfinance is a double bottom line sector which is growing fast, making money and doing well in a variety of socially interesting ways. The growth of its institutions requires good strategies, good control systems, and informed decision making, all of which require an appropriate Management Information System (MIS). While a good MIS is needed in any sector, the management of a double bottom line requires systems which yield information on economic, financial, and social metrics. The essays in this book explore the metrics required for success in this field. Communicating on these metrics may provide competitive advantage in fund raising. Reaching out to the bottom of the pyramid requires low cost catalytic innovations, disrupting the existing way of doing things. These necessitate not only social innovations but also technological innovations to reduce costs drastically. The book presents various alternative ways of distributing software for microfinance, including case studies on open source and cloud based software, indicating how software providers are seeking to create competitive advantage. It offers a detailed analysis of the problems that are often faced and innovative techniques for implementing MIS in microfinance. This volume represents essential reading for anyone interested in learning about not only microfinance and MIS but also social innovations and competitive advantage strategies. The contributors to the book are executives, consultants, and academics who have considerable research experience in working and researching in these areas. Their work has been reviewed and developed by comments from both academics and practitioners to yield a book which is useful to students, academics, and practitioners alike.

The Renaissance of Legacy Systems Ian Warren, 2012-12-06 Today software professionals recognize that change in software systems is inevitable There are many systems currently in operation however which were developed before the need for change was understood Such systems are commonly referred to as legacy systems and were developed with relatively short lifetimes in mind Software engineering is a relatively young discipline which is continually improving to provide better support for the development of software systems What were once state of the art techniques tools and processes are now dated and have resulted in systems which are not responsive to change For historical reasons dated development practice traded maintainability for other system attributes such as cost and performance A significant number of legacy systems remain in operation because they are critical to the business processes which they support The combination of extended lifetimes and poor maintainability means that legacy

systems are expensive to change and in many cases they cannot accommodate emerging requirements This is clearly an undesirable situation which until recently has been tackled by replacing the system or attempting to maintain it Replacing a legacy system is dangerous since you face the risk of losing vital business knowledge which is embedded in many old systems In many cases system replacement is not cost effective Conversely if you attempt to maintain a legacy system there is often little return on the investment in maintenance effort and the system remains difficult and expensive to change
