Chemical Processes for Pollution Prevention and Control Paul Mac Berthouex, Linfield C. Brown, 2017-10-04 This book examines how chemistry, chemical processes, and transformations are used for pollution prevention and control. Pollution prevention reduces or eliminates pollution at the source, whereas pollution control involves destroying, reducing, or managing pollutants that cannot be eliminated at the source. Applications of environmental chemistry are further illustrated by nearly 150 figures, numerous example calculations, and several case studies designed to develop analytical and problem-solving skills. The book presents a variety of practical applications and is unique in its integration of pollution prevention and control as well as air, water, and solid waste management.

Development document for final effluent limitations guidelines and standards for the iron and steel manufacturing point source category, 2002 EPA-600/7, 1979 SME Mineral Processing and Extractive Metallurgy Handbook Courtney A. Groundwater Treatment Technology Evan K. Nyer, 1992-05-15 Groundwater treatment is unique. Removing the sources of contamination as we did when we cleaned a river or lake is only the first step. A groundwater remediation must include cleaning of the body of water itself, the aquifer. The revised and updated edition of

Groundwater Treatment Technology provides a complete review of the technologies developed over the past 10 years for groundwater treatment. It also explains the design techniques that are required to apply those technologies successfully in a groundwater cleanup. Featured areas of coverage include Specific design methods for the various technologies that are merely described in other publications. Physical chemical and treatability properties of 30 organic compounds that are most often encountered in groundwater situations. Detailed strategies for remediation. New biological treatment methods. Specific data on treatment methods as applied in the field. Practical suggestions on applications of technologies for groundwater treatment. Drawing on his experience as a designer of over 100 groundwater treatment systems, Evan K. Nyer starts by showing how to develop the data necessary to define what type of treatment is necessary. He then explains how groundwater treatment is unique. Nyer follows with expert accounts of specific treatment technologies. Physical chemical organic methods such as air stripping, carbon adsorption, and pure compound removal are explored in detail. In addition, new techniques including UV Oxidation and other emerging technologies are explained and directly related to groundwater design situations. An entire chapter is devoted to biological methods, one of the most promising areas for organic groundwater treatment. There is also comprehensive coverage of inorganic methods that addresses everything from precipitation to solids liquid separation and advanced ion removal methods. This definitive sourcebook also contains helpful cost factor analyses plus representative case histories showing how the techniques of groundwater treatment have been applied in the field. Wide ranging authoritative and completely updated. The Second Edition of Groundwater Treatment Technology is essential reading for wastewater engineers, industrial managers, hydrologists, soil experts, government officials, and environmental lawyers who want to keep abreast of the latest developments in this important field.

Antimony Removal Technology for Mining Industry Wastewaters C. Leon Parker, Efim Livshits, Kathleen McKeon, 1979
Separating Pro-Environment Technologies for Waste Treatment, Soil and Sediments Remediation Vincenzo Gente, Floriana La Marca, 2012-11-29

The removal of contaminants and pollutants from natural or valuable materials is a critical issue in environmental management and conservation. Fundamentally, the procedure consists of measures employed to separate what is good, recyclable materials, soil, and sediments from what is bad, non-recyclable materials, contaminants. A perspective of current technologies developed for mineral processing is of great assistance for finding appropriate solutions for different environmental situations. The liberation and separation processes adopted to recover valuable minerals from a gangue are in principle the same processes that can be applied to waste materials for recovering useful materials and to soil and sediments to reduce contamination. Separating Pro-Environment Technologies for Waste Treatment, Soil and Sediments Remediation investigates how technologies for separation that take origin from mineral processing have improved and evolved when applied to waste treatment and soil and sediment remediation.

Regolith Exploration Geochemistry in Tropical and Subtropical Terrains C.R.M. Butt, H. Zeegers, 2015-12-04. The use of exploration geochemistry has increased enormously in

the last decade The present volume specifically addresses those geochemical exploration practices appropriate for tropical sub tropical and adjacent areas in environments ranging from rainforest to desert Practical recommendations are made for the optimization of sampling and analytical and interpretational procedures for exploration according to the particular nature of tropically weathered terrains The underlying theme is the recognition that regions between 35 N and 35 S in particular have a common history of deep chemical weathering and lateritization during the late Mesozoic and early Tertiary This has had a profound and lasting effect so that the surface geochemical expressions of mineralization throughout these regions have many similar features with local modification due to more recent weathering under changed climates The volume discusses the data derived from numerous research and case studies in terms of exploration and dispersion models based on the weathering and geomorphological history The models permit valid comparisons between equivalent terrains that may be geographically widely separated and situated in quite different climatic environments The basis of the volume is to view geochemical dispersion within the context of a genetic understanding of the evolution of landforms and the regolith i e landscape geochemistry and to develop exploration procedures based on this understanding This book should be of interest to exploration geochemists economic geologists soil scientists geomorphologists and environmental geochemists **EPA**
