#### OBJECTIVES:

 To verify Ohm's Law, which defines the relationship between voltage, current and resistance in a series circuit. Ohm's law states that the total current in a circuit (I) is equal to the total impressed voltage (E) divided by the total series resistance (R). The fundamental mathematical form of Ohm's Law is:

$$I = \frac{E}{R}$$

Where: I is the total circuit current in amperes

E is the total impressed voltage in volts

R is the total resistance in ohms.

- To verify the law for resistors in series, which states that in a series circuit, the total resistance of the series circuit is equal to the sum of the individual series resistances.
- 3. To become familiar with the resistor color code used to identify resistance values. In this color code each color represents a specific digit from 0 through 9. "The color bands are always read from the end that has the band closest to it ... The first and second bands represent the first two digits, respectively. The third band determines the power-of-10 multiplier for the first two digits (actually the number of zeros that follow the first and second digit)." The fourth band (or lack thereof) specifies the manufacturer's tolerance for the resistance value. The colors and the associated digits are:

| Bands 1-3<br>(Nominal Resistance) |         | Band 4<br>(Felerator) |         |
