**Network-on-Chip Architectures** Chrysostomos Nicopoulos,Vijaykrishnan Narayanan,Chita R. Das,2009-09-18 2 The Cell Processor from Sony Toshiba and IBM STI 3 and the Sun UltraSPARC T1 formerly codenamed Niagara 4 signal the growing popularity of such systems Furthermore Intel s very recently announced 80 core TeraFLOP chip 5 exemplifies the irreversible march toward many core systems with tens or even hundreds of processing elements 1 2 The Dawn of the Communication Centric Revolution The multi core thrust has ushered the gradual displacement of the computati centric

design model by a more communication centric approach 6 The large sophisticated monolithic modules are giving way to several smaller simpler processing elements working in tandem This trend has led to a surge in the popularity of multi core systems which typically manifest themselves in two distinct incarnations heterogeneous Multi Processor Systems on Chip MPSoC and homogeneous Chip Multi Processors CMP The SoC philosophy revolves around the technique of Platform Based Design PBD 7 which advocates the reuse of Intellectual Property IP cores in flexible design templates that can be customized accordingly to satisfy the demands of particular implementations The appeal of such a modular approach lies in the substantially reduced Time To Market TTM incubation period which is a direct outcome of lower circuit complexity and reduced design effort The whole system can now be viewed as a diverse collection of pre existing IP components integrated on a single die

*Modeling, Analysis and Optimization of Network-on-Chip Communication Architectures* Umit Y. Ogras,Radu Marculescu,2013-03-12 Traditionally design space exploration for Systems on Chip SoCs has focused on the computational aspects of the problem at hand However as the number of components on a single chip and their performance continue to increase the communication architecture plays a major role in the area performance and energy consumption of the overall system As a result a shift from computation based to communication based design becomes mandatory Towards this end network on chip NoC communication architectures have emerged recently as a promising alternative to classical bus and point to point communication architectures In this dissertation we study outstanding research problems related to modeling analysis and optimization of NoC communication architectures More precisely we present novel design methodologies software tools and FPGA prototypes to aid the design of application specific NoCs **Three-Dimensional Integrated**

**Circuit Design** Yuan Xie,Jingsheng Jason Cong,Sachin Sapatnekar,2009-12-02 We live in a time of great change In the electronics world the last several decades have seen unprecedented growth and advancement described by Moore s law This observation stated that transistor density in integrated circuits doubles every 1 5 2 years This came with the simultaneous improvement of individual device performance as well as the reduction of device power such that the total power of the resulting ICs remained under control No trend remains constant forever and this is unfortunately the case with Moore s law The trouble began a number of years ago when CMOS devices were no longer able to proceed along the classical scaling trends Key device parameters such as gate oxide thickness were simply no longer able to scale As a result device static currents began to creep up at an alarming rate These continuing problems with classical scaling have led to a leveling off of IC clock speeds to the range of several GHz Of course chips can be clocked higher but the thermal issues become unmanageable This has led to the recent trend toward microprocessors with multiple cores each running at a few GHz at the most The goal is to continue improving performance via parallelism by adding more and more cores instead of increasing speed The challenge here is to ensure that general purpose codes can be efficiently parallelized There is another potential solution to the problem of how to improve CMOS technology performance three dimensional integrated circuits 3D ICs

*Asynchronous On-Chip Networks and Fault-Tolerant Techniques* Wei Song, Guangda Zhang, 2022-05-10 Asynchronous On Chip Networks and Fault Tolerant Techniques is the first comprehensive study of fault tolerance and fault caused deadlock effects in asynchronous on chip networks aiming to overcome these drawbacks and ensure greater reliability of applications As a promising alternative to the widely used synchronous on chip networks for multicore processors asynchronous on chip networks can be vulnerable to faults even if they can deliver the same performance with much lower energy and area compared with their synchronous counterparts faults can not only corrupt data transmission but also cause a unique type of deadlock By adopting a new redundant code along with a dynamic fault detection and recovery scheme the authors demonstrate that asynchronous on chip networks can be efficiently hardened to tolerate both transient and permanent faults and overcome fault caused deadlocks This book will serve as an essential guide for researchers and students studying interconnection networks fault tolerant computing asynchronous system design circuit design and on chip networking as well as for professionals interested in designing fault tolerant and high throughput asynchronous circuits Network and Parallel Computing Chen Ding, Zhiyuan Shao, Ran Zheng, 2010-09-10 This book constitutes the refereed proceedings of the IFIP International Conference NPC 2010 held in Zhengzhou China in September 2010 The 39 papers presented were carefully selected from 89 submissions The papers are organized in topical sections on Parallelization and Optimization Parallel Algorithms Network CPU and Multicore Cloud and Grid Infrastructure Network on Chip Network and Parallel Computing Ching-Hsien Hsu, Xiaoming Li, Xuanhua Shi, Ran Zheng, 2013-09-12 This book constitutes the proceedings of the 10th IFIP International Conference on Network and Parallel Computing NPC 2013 held in Guiyang China in September 2013 The 34 papers presented in this volume were carefully reviewed and selected from 109 submissions They are organized in topical sections named parallel programming and algorithms cloud resource management parallel architectures multi core computing and GPU and miscellaneous Designing Embedded Processors Jörg Henkel, Sri Parameswaran, 2007-07-27 As we embrace the world of personal portable and perplexingly complex digital systems it has befallen upon the bewildered designer to take advantage of the available transistors to produce a system which is small fast cheap and correct yet possesses increased functionality Increasingly these systems have to consume little energy Designers are increasingly turning towards small processors which are low power and customize these processors both in software and hardware to achieve their objectives of a low power system which is verified and has short design turnaround times Designing Embedded Processors examines the many ways in which processor based systems are designed to allow low power devices It looks at processor design methods memory optimization dynamic voltage scaling methods compiler methods and multi processor methods Each section has an introductory chapter to give a breadth view and have a few specialist chapters in the area to give a deeper perspective The book provides a good starting point to engineers in the area and to research students embarking upon the exciting area of embedded systems and architectures
