## Introduction

Fish and fishery products constitute an important food component for a large section of world population, more so in developing countries, where fish forms a cheap source of protein. In the last two decades there has been an increase in awareness about the nutritional and health benefits of fish consumption. The low fat content of some fish and the presence of poly unsaturated fatty acids in red meat fishes which are known to reduce the risks of coronary heart diseases, have increased the dietary and health significance of seafood consumption (Din et al., 2004). In USA, seafood consumption has increased from an average of 4.5 kg per person in 1960 to about 7.0 kg per person in 2002 (NOAA, 2003). Total fishery production in 2001 was reported to be 130.2 million tonnes, of which 37.9 (30%) million tonnes was from aquaculture, 90% of which came from Asian countries. On the other hand, seafood is also known to have been responsible for a significant percentage of food borne diseases. With increased fish consumption, there is also an increase in the number of food-borne illness associated with fishery products. In the United States, 10-19% of food-borne illness involved seafood as a vehicle and between 1993 and 1997, 6.8% of the food-borne illnesses involved consumption of fish and shellfish (FAQ, 2004). In Japan, where seafood consumption is high and raw fish consumption is popular, 70% of food-borne illness is attributed to seafood. These data highlight the importance of seafood as vehicles for human illness.

However, the true incidence of seafood-borne diseases worldwide is not known, as there is no surveillance system in the developing countries. In addition to being responsible for human health problems, the presence of infectious agents in seafood results in rejection of seafood consignments leading to major economic losses to exporting countries in general, and to seafood processing industries in particular. Maintenance of seafood quality is central to ensuring the safety of seafood. This has been a major area of concern for seafood processing industries and a great challenge to scientists and researchers worldwide. This review focuses on agents

and causes of human illness encountered in seafood and issues related to seafood safety and quality management.

## Causes of seafood-borne illness

Seafood often harbour infectious agents that are present naturally in the aquatic environment or introduced through human activities. The illness may be due to the infection caused by the micro-organism or due to the intoxication by products of microorganisms. Viruses, bacteria and parasites are the agents of human disease associated with seafoods. The products of microorganism such as bacterial toxins, algal toxins or products of bacterial metabolism such as histamine can cause intoxication when fish or shellfish harbouring these products are consumed. In the case of live finfish, microorganisms may be associated with gill, gut and skin. Filter feeding shellfish like mollusks concentrate different types of microorganisms present in the environment around them. Some of the microorganisms of human health concern may be native to the aquatic environment such as the members of the genus *Vibrio* but others like *Salmonella*, *E. coli* and many viruses are introduced into the aquatic environment through human activities such as contamination by domestic sewage. The type of microorganism associated with seafood may vary depending upon whether it is fresh or processed. Most of the outbreaks of illnesses occur in countries where seafood is eaten raw or is inadequately cooked. For example, in Japan where seafood is eaten raw, 70% of food borne human illness is seafood associated (Scoging 2003).

## Viruses associated with seafoods

Viruses constitute an important cause of seafood borne diseases. The intensity of human illness is known only from developed countries. For example in the USA, it is estimated that 80% of food borne illness are due to enteric viruses (Sair et al., 2002). The major limitation in diagnosing viral infections is the non-availability of techniques or facilities for detecting or identifying viral pathogens. The recent advances in

Bebee, National Agricultural Library (U.S.), 1977     **Microbial Ecology of Foods V2** International Commission on Microbiological Specifications for Foods, Unknown ICMSF, 2012-12-02 Microbial Ecology of Foods Volume II Food Commodities is a comprehensive treatise on the microbiology of specific commodity groups. The commodity groups discussed include meat, milk, egg, fish, shellfish and their products. Other groups included are feeds of animal origin and pet foods, agricultural crops and their products, fats and oils, beverages, confectioneries, miscellaneous foods and natural mineral waters. Composed of 15 chapters, this book has chapters that cover the important properties of the food commodity that affects the microbial content. The initial microbial flora on flesh foods at slaughter or on vegetable foods at harvest and the effects of harvest, transport, processing and storage on the microbial content are discussed as well. Furthermore, this text explains the means of controlling the process and the microbial content. Each chapter is a review of applied microbiology compiled by leading authorities selected solely for their expert knowledge. The final chapter emphasizes factors that contribute to outbreaks of foodborne disease. This volume will greatly appeal to those interested primarily in applied aspects of food microbiology such as food processors, microbiologists and technologists, veterinarians, public health workers and regulatory officials.
