INTRODUCTION

Microbiology is the study of organisms that are visible only with a microscope.

HISTORY OF MICROBIOLOGY

- Robert Hooke:** first describing cells in 1665 when he used a microscope to observe a block of cork.
- Anton van Leeuwenhoek:** discovered microscopes, the terms in English of pond water and animal teeth. In 1677, he dubbed these organisms "animalcules."
- Louis Pasteur:**
 - identified microorganisms as the cause of alcohol fermentation and lactic acid products.
 - disproved the theory of spontaneous generation—the idea that organisms may arise from inanimate matter, such as beef broth.
 - proposed the **germ theory of disease**, which states that microorganisms cause infectious diseases.

- Developed germ theory and vaccines.
- Robert Koch:** proved Pasteur's germ theory of disease through experimentation with anthrax in its incubator, and **Koch's postulates**.

- The same microorganisms are observed in every case of the disease.
- The microorganisms are isolated and cultured outside the body of the sick animal.
- The microorganism is injected into a healthy animal of the same species, causing the same disease.
- An identical microorganism is isolated from the newly sick animal.

EXPERIMENTAL

THE CELL THEORY

Every living organism is made up of cells, which are the lowest level of structural capacity of performing all the activities of life. All cells arise from pre-existing cells.

PROKARYOTIC VS. EUKARYOTIC MICROORGANISMS

Several cell components exist in all types of cells.

- Cell membrane:** serves as an external barrier and encloses organelles.
- The basic unit is a **phospholipid molecule**, with a polar phosphate group as its hydrophilic head and two non-polar fatty acid chains as hydrophobic tails.
- Individual phospholipids form a fluid **phospholipid bilayer**, with hydrophilic heads facing out, and hydrophobic tails facing in to form a aqueous zone that separates the watery cell interior from the extracellular environment.
- Cell membranes** are **semipermeable**, allowing passage of gases, liquids, and small polar molecules. Cell membranes are not permeable to charged molecules ions and proteins and large polar molecules.
- Membrane proteins:** protein molecules embedded in the bilayer transport molecules unable to cross the membrane independently, assist in biologically important reactions, and interact with molecules of neighboring cells.
- Cytoplasm:** a semifluid medium (called **cytosol**) and all the organelles inside the plasma membrane but outside the nucleus.
- Cytoskeleton:** system of protein filaments in the cytoplasm

including **microtubules** and **microfilaments** that gives the cell shape and helps direct movement.

- Ribosomes:** proteins that work with RNA to synthesize polypeptides.

PROKARYOTES

The simplest unicellular organisms and the earliest cells to evolve. **Characteristics** that make differences from eukaryotes include:

- Genetic material floats in the cytoplasm in a concentrated but unenclosed region called the **nucleoid**.
- No membrane-bound organelles.

EUKARYOTES

Found in multicellular organisms and multicellular plants and animals, contain membrane-bound organelles, each of which performs a specific function and increases efficiency.

METABOLISM

CELLULAR RESPIRATION

Cellular process of oxidizing glucose or food molecules to obtain energy in the form of **adenosine triphosphate (ATP)**.

GLYCOLYSIS

The oldest metabolic pathway, used by all cells, and a precursor to both the aerobic and anaerobic respiratory pathways. Glycolysis occurs in the cytoplasm. The six-carbon sugar glucose is degraded to form two molecules of three-carbon pyruvate, resulting in two NADH and two net ATP.

FERMENTATION

In the absence of oxygen, respiration relies on glucose to produce ATP. This **anaerobic** process uses an organic molecule to accept the electrons from NADH and reform NADH for glycolysis to run again. Much energy is released in the form of by-products, such as ethanol or lactic acid. Three types of fermentation exist:

- Homolactic:** bacteria convert pyruvate to lactic acid.
- Alcoholic:** yeast and bacteria convert pyruvate into ethanol and CO₂.
- Heterolactic:** organisms produce lactic acid as well as other acids and alcohols.

OXIDATIVE RESPIRATION

If oxygen is present, glycolysis leads to **aerobic** respiration, which produces a net total of 38 ATP per molecule of glucose.

- Collection of pyruvate:** carbon dioxide enters cell from pyruvate to produce acetyl-CoA and NADH.
- Citric acid cycle (Krebs cycle):** begins with acetyl-CoA joining oxaloacetic acid to form citric acid, which is oxidized to CO₂, yielding ATP, NADH, and FADH. Oxaloacetic acid is regenerated for another cycle. Occurs in the mitochondria of eukaryotes and the cytoplasm of aerobic prokaryotes.

FAQs About Microbiology Sparkcharts Books

What is a Microbiology Sparkcharts PDF? A PDF (Portable Document Format) is a file format developed by Adobe that preserves the layout and formatting of a document, regardless of the software, hardware, or operating system used to view or print it. **How do I create a Microbiology Sparkcharts PDF?** There are several ways to create a PDF: Use software like Adobe Acrobat, Microsoft Word, or Google Docs, which often have built-in PDF creation tools. Print to PDF: Many applications and operating systems have a "Print to PDF" option that allows you to save a document as a PDF file instead of printing it on paper. Online converters: There are various online tools that can convert different file types to PDF. **How do I edit a Microbiology Sparkcharts PDF?** Editing a PDF can be done with software like Adobe Acrobat, which allows direct editing of text, images, and other elements within the PDF. Some free tools, like PDFescape or Smallpdf, also offer basic editing capabilities. **How do I convert a Microbiology Sparkcharts PDF to another file format?** There are multiple ways to convert a PDF to another format: Use online converters like Smallpdf, Zamzar, or Adobe Acrobats export feature to convert PDFs to formats like Word, Excel, JPEG, etc. Software like Adobe Acrobat, Microsoft Word, or other PDF editors may have options to export or save PDFs in different formats. **How do I password-protect a Microbiology Sparkcharts PDF?** Most PDF editing software allows you to add password protection. In Adobe Acrobat, for instance, you can go to "File" -> "Properties" -> "Security" to set a password to restrict access or editing capabilities. Are there any free alternatives to Adobe Acrobat for working with PDFs? Yes, there are many free alternatives for working with PDFs, such as: LibreOffice: Offers PDF editing features. PDFsam: Allows splitting, merging, and editing PDFs. Foxit Reader: Provides basic PDF viewing and editing capabilities. How do I compress a PDF file? You can use online tools like Smallpdf, ILovePDF, or desktop software like Adobe Acrobat to compress PDF files without significant quality loss. Compression reduces the file size, making it easier to share and download. Can I fill out forms in a PDF file? Yes, most PDF viewers/editors like Adobe Acrobat, Preview (on Mac), or various online tools allow you to fill out forms in PDF files by selecting text fields and entering information. Are there any restrictions when working with PDFs? Some PDFs might have restrictions set by their creator, such as password protection, editing restrictions, or print restrictions. Breaking these restrictions might require specific software or tools, which may or may not be legal depending on the circumstances and local laws.
