Exhaust Plume Temperature Effects on Nozzle Afterbody Performance Over the Transonic Mach Number Range C. E. Robinson,M. Dean High,1974 Results of an experimental and analytical research investigation on nozzle afterbody drag are presented Experimental afterbody and boattail drag coefficients and pressure distributions are discussed for an isolated strut mounted nozzle afterbody model for the Mach number range from 0.6 to 1.5 Some data are also given for free stream unit Reynolds numbers from one million to approximately four million per foot The experimental data were obtained for the basic model with an air cooled and a water cooled Ethylene air combustor to provide hot jet duplication as well as cold jet simulation The temperature of the nozzle exhaust gas was varied from 530R burner off to approximately 2500R for several nozzle pressure ratios from jet off to those corresponding to a moderately under expanded exhaust plume The initial series of experiments was conducted with the air cooled combustors and the effect of jet temperature on afterbody drag was somewhat masked by the effects of the secondary airflow from the cooling air The general trend however shows a decreasing afterbody drag with increasing exhaust gas temperature and with decreasing

Gannon, Michael L. Norman, 2012-12-06 Structured adaptive mesh refinement SAMR methods have matured over the past 20 years and are now the method of choice for certain difficult problems such as compressible flow SAMR presents difficult technical challenges both in terms of the numerical techniques involved and the complexity of the programming effort especially on parallel computers In order to gain insight into managing these difficulties much research effort has been directed at mesh generation parallel computation and improvements in accuracy aimed primarily at refinement interfaces A major stumbling block in this endeavor is that many of these techniques entail substantial amounts of problem specific detail Standardization is highly unlikely except within narrowly defined problem domains The papers presented in this collection are based on talks given at the Workshop on Structured Adaptive Mesh Refinement Grid Methods held at the Institute for Mathematics and its Applications University of Minnesota on March 12 13 1997 They describe research to improve the general understanding of the application of SAMR to practical problems identify issues critical to efficient and effective implementation on high performance computers stimulate the development of a community code repository for software including benchmarks to assist in the evaluation of software and compiler technologies The ten chapters of this volume have been divided into two parts reflecting two major issues in the topic I programming complexity of SAMR algorithms and II applicability and numerical challenges of SAMR methods Part I presents three programming environments and two libraries that address the concerns of efficient execution and reduced software development times of SAMR applications Part II describes an overview of applications that can benefit from SAMR methods ranging from crack propagation and industrial boilers to
